6

Account Intelligence, client web app

Client web audit and redesign proposal

Every client page was opened, read in code and checked against the API behind it. This document shows what is wrong today, what to merge or remove, and how each screen should look. Nothing in the code has been changed. Approve it, or mark what to change.

Date	Scope	Pages audited	Branch
7 November 2026	Client web only (operator console excluded)	23 routes, 17 data sheets	feat/final-product

Summary

The app works, but it shows clients too much of how it works. The account page carries 50+ controls, research can be started from six places, and internal words from the pipeline reach client screens. The fix is mostly removal: fewer pages, one main action per screen, plain words, and a flatter look in the white and pastel palette you already chose.

18 → 5
client areas after merging (plus sign-in and legal)

8 → 4
sidebar nav items

50+ → ~15
controls on the account page

6 → 1
ways to start a paid research

21 → 6
font sizes in use

The ten changes that matter most

1. **Cut the account page to tabs**
   17-link rail, 4 tiles, delivered-files viewer and 5 downloads become 8 tabs and one Download menu.

2. **Remove internal words from client screens**
   gate, withheld, checklist rows, units, lanes, passages, Raw pull, Stay local, Summary homework, Distill, HTTP codes.

3. **One way to start research**
   Six entry points today (Add account, New research, Research board, Refresh, Resume, Ask search) become one form and one Refresh dialog, both with the two-step confirm.

4. **Nav from 8 items to 4**
   Ask, Accounts, Research, Settings. Schedules, Mail and drive, Team, Support access and Model preferences move into Settings.

5. **Fix the live bugs found**
   File analysis shows "undefined" and overlapping text; run page contradicts itself; Research board misses finished runs; raw values in tables.

6. **Hide cost and model controls behind one menu**
   Keep the estimate before any paid run and the Ask context ring; move model and effort chips into a single settings menu.

7. **One component set**
   One table, one badge, one dialog (replaces 6 browser confirm boxes), one page header, one input style. Delete the second page-frame system.

8. **Flatter look**
   Radius 8/12 instead of 20/22, no drop shadows, hairline borders, one type scale (today 21 font sizes).

9. **Fix the document viewer load**
   Page the text on the client instead of 50 server calls before first paint.

10. **Fill the legal pages**
    Required before Google and Microsoft review the Mail and drive apps.

What is wrong today

Six problems repeat across the client app. Each one is backed by what we saw on screen and in the code.

Internal words reach clients

Run steps called "Summary homework", "Distill" and "Pre delivery gate"; "checklist rows reported"; "Units used"; "withheld"; "Lanes"; "passages", "Indexing", "Raw pull"; "Stay local"; HTTP status codes in the Delete account error; QA banners that say a view is "not to be quoted".

The account page is overloaded

About 2,600 lines of code and 50+ controls. A 17-link Deep dive rail, 4 tiles that repeat 4 of those links, a progress card, summary, findings, a composer that leaves the page, a full delivered-files viewer and two file cards. Five download buttons, two of them both called "Download all" doing different things.

The same job in many places

Start research: Add account, New research, the Research board, Refresh, Resume and Ask's search toggle. Watch a run: the account card, the Research board and the run page. Uploaded files: four different views. Schedule: a page, a button and a column.

Bugs visible on screen

File analysis says "Your files speak to undefined" and "Analysis of 0 files" while the account lists 19 ready files; finding text overlaps the file path. The run page says every step is Done next to "0 of 6 rows reported" and 0 tokens. Jobs show raw values like "data_ai". People filters all read 0.

Two design systems

Two page frames, four table components, five badge styles, three input styles, six browser confirm boxes plus a custom modal, 21 font sizes, a second off-palette colour set for the token card, and the logo still in the old colours.

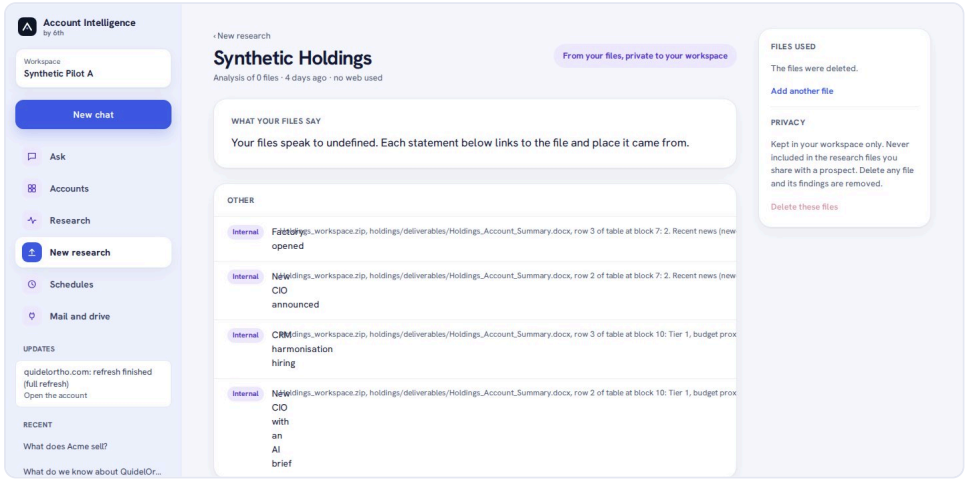

Not ready for outside eyes

Privacy and Terms are live with "[Effective date]" and "[Company legal name]". Google and Microsoft will read the privacy page when they review the Mail and drive apps. The sign-in workspace picker shows raw IDs.

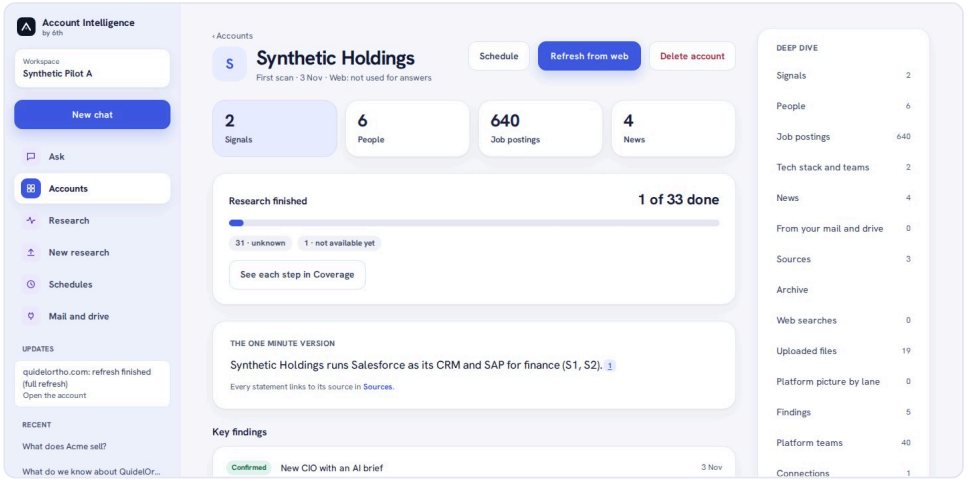

Evidence from the running app

Screenshots taken on 7 November from the local build of this branch, signed in as the test workspace.

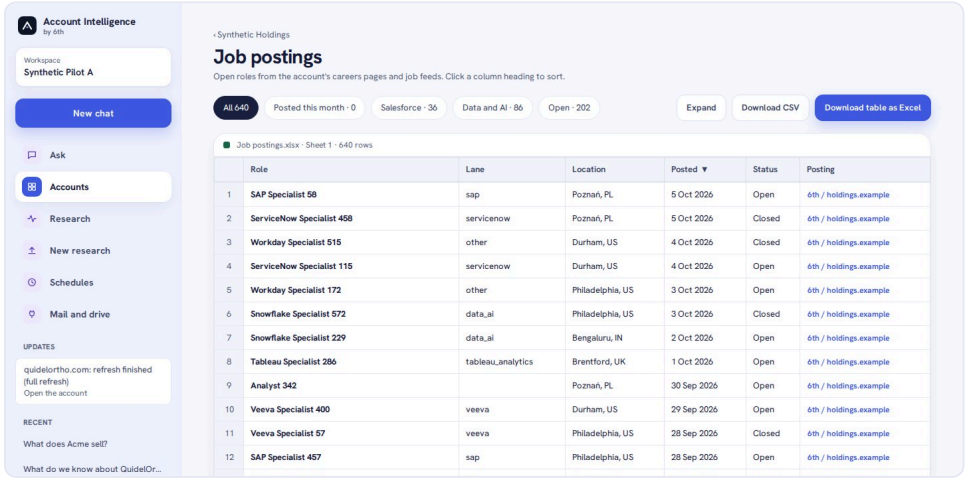

File analysis: "undefined", "0 files", overlapping text

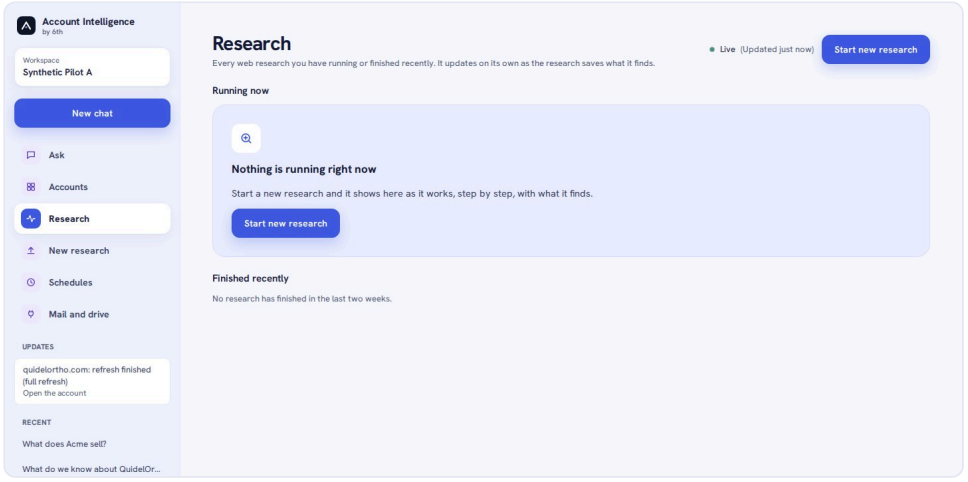

Account page: 17-link rail, "Research finished, 1 of 33 done", 31 unknown

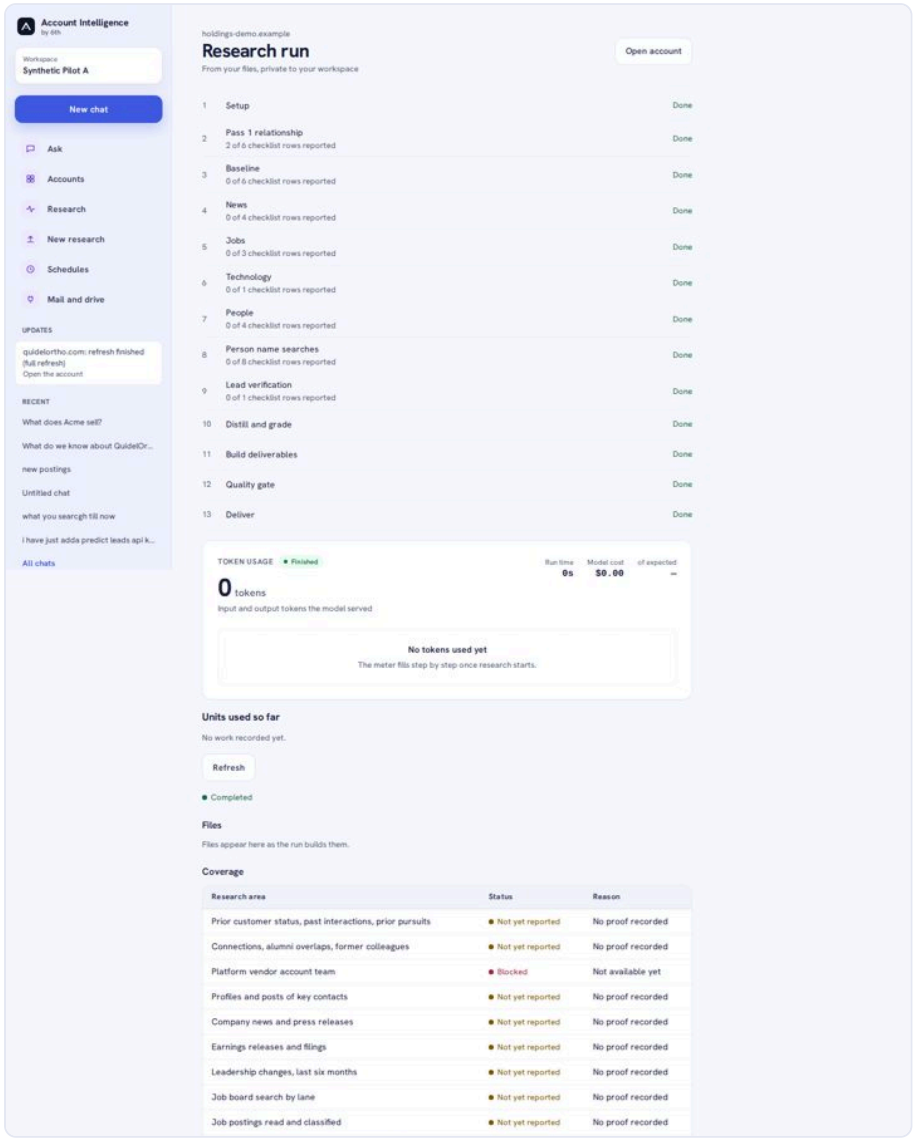

Jobs sheet: raw values, three downloads, a filter at 0

Research board: "No research has finished" with two runs 4 days old

The run page shows the pipeline, not the result

This page is reachable by every client. It lists 13 internal steps, all marked Done, beside "0 of 6 checklist rows reported". The token card says 0 tokens and $0.00 for a finished run. Below it, a 33-row table says "Not yet reported" and "No proof recorded" on almost every line, under a green "Completed".

A client reading this cannot tell whether the research worked. The proposal replaces it with five plain steps, live counts of what was found, and one sentence on what could not be found and why. The pre-delivery gate, defect codes and the coverage table stay on the operator console.

Also on this page

- "Units used so far" with a Refresh button in the middle of the page
- A different page frame from every other screen (`.page` vs `.pg`)
- Client-only render, so it is blank until all calls return

Every client page, one by one

Keep = leave as is. Simplify = same page, less on it. Merge = moves into another screen. Remove = deleted, old link redirects. Fix = broken today.

Page	Verdict	What is wrong	Proposal
Ask (home) `/`	Simplify	Model, effort, token ring and a $ line under every answer compete with the answer. "Search: off" looks like a toggle but opens Refresh. One-line input for long questions. The sources panel is rendered twice.	Keep as home. One quiet composer row; answer settings in one menu; keep the context ring (your choice).
All chats `/chats`	Merge	A second list of the sidebar's Recent chats. No search or paging. Delete uses the browser's own confirm box.	A searchable history panel inside Ask.
Accounts `/accounts`	Simplify	"Lanes" column shows "No lanes yet" on every row. No search or filter. Refresh column repeats the Schedules page. Scrolls sideways on phones.	Add search and status filter; auto refresh editable in the row.
Add account `/accounts/add`	Merge	Three numbered cards; the third is only a link to another page. Model and effort chips at the very first step.	One "Start research" form on the Research page and in a dialog from Accounts.
Account `/accounts/[domain]`	Simplify	About 2,600 lines and 50+ controls: 17-link Deep dive rail, 4 tiles that repeat the rail, 5 download buttons (two both called "Download all"), Delete next to the main action, QA text such as "this view is not to be quoted".	Tabbed account page: Overview, People, Jobs, Technology, News and signals, Sources, Files, Activity. One main action.
Data sheets `/accounts/[domain]/[sheet]`	Simplify	Three downloads in the header, two pagers, empty columns shown, raw values such as "data_ai" and "tableau_analytics", filter chips that all read 0.	Becomes the body of each account tab. One Download menu, one pager, hide empty columns.
File analysis `/accounts/[domain]/files`	Fix Merge	Live bug: "Your files speak to undefined", "Analysis of 0 files", "The files were deleted" while the account shows 19 ready files; text overlaps the file path. Back link says "New research".	Section of the account Files tab.

Every client page, continued

Page	Verdict	What is wrong	Proposal
Archive `/accounts/[domain]/archive`	Simplify	9 free-text filters, a 10-column table, "Download JSON", back link shows the domain instead of the name.	Keep the archived-copy view; list lives under Sources with one search box.
Refresh `/accounts/[domain]/refresh`	Merge	Tokens and $ on every option, model chips, "Stay local" button. A full page for one choice.	A two-step dialog on the account page (confirm twice kept).
Document viewer `/accounts/[domain]/documents/[id]`	Simplify	Server makes up to 50 calls of 200 passages in a row before showing anything; the test page grew to 1.3 million pixels tall. Words like "passages", "Raw pull", "Build file".	File viewer inside Files: contents list, search, paged text.
Research board `/research`	Simplify	"Model tokens" tile, "withheld" wording, connection status chatter, a third start-research form. Showed "No research finished" while two runs had finished 4 days earlier.	Research page = start form + running + recent.
New research `/research/new`	Merge	Company tab is the same form as Add account. File tab shows "Scanning" and "Indexing".	Tab of the Research start form.
Research run `/runs/[run_id]`	Remove	The most internal screen a client can reach: 13 steps all "Done" next to "0 of 6 checklist rows reported", 0 tokens, "Units used", 33-row coverage table of "Not yet reported", pre-delivery gate codes.	Plain 5-step progress page under Research.
Schedules `/schedules`	Remove	A whole nav item for one setting per account. "Everything stays local".	Auto refresh set in the Accounts list and the account Activity tab.

Every client page, continued

Page	Verdict	What is wrong	Proposal
Mail and drive `/mail-and-drive`	Merge	Fine on its own; its own copy of the status pill; browser confirm on Disconnect.	Settings, Mail and drive tab.
Model preferences `/model-preferences`	Merge	Reachable only from the sidebar footer; the same choices repeat as chips on Ask, Add account and Refresh.	Settings, Models tab.
Team `/team`	Merge	People-data consent is hidden under Teammates. Different input style from the rest.	Settings, Team tab.
Support access `/support-access`	Merge	A top-level nav slot for a rare admin task.	Settings, Support access tab.
Sign in `/login`	Simplify	Workspace picker shows raw IDs; the 6th staff console link sits on the client sign-in.	Keep the split layout; workspace names; staff link in the footer.
Forgot, reset, invite, verify `/forgot …`	Keep	Invite-expired copy says "Ask 6th"; invites now come from your own admin. Verify page has no explanation.	Same frame as Sign in; fix the copy.
Privacy, Terms `/privacy, /terms`	Fix	Published with placeholders: [Effective date], [Company legal name], [Registered address], [To be completed by counsel].	Fill before any Google or Microsoft app review.

From 18 client pages to 5 areas

Old addresses keep working: each one redirects to its new home, so links in emails and bookmarks do not break.

Proposed

Ask
Chat, history panel, sources

Accounts
List with search, filter, auto refresh; Add account dialog

Account
Overview · People · Jobs · Technology · News and signals · Sources · Files · Activity; Refresh dialog

Research
Start (company or file) · Running · Recent · Progress page

Settings
Models · Team · Mail and drive · Support access · Usage

Sidebar

Ask, Accounts, Research, Settings. Below: recent chats and All chats. At the bottom: you, and how many researches are left this month. The big "New chat" button goes; Ask is the home page.

Unchanged

Sign in, forgot password, reset, invite, verify email, privacy, terms. The archived-copy view of a page stays as a deep link from Sources.

Design direction

Your palette from 23 October stays: white, periwinkle blue and lavender, with mint, butter and rose only for status. What changes is the weight. Today every block is a rounded card (20px corners) with a soft shadow. The proposal is flat and quieter, closer to a well-made report than a dashboard.

Colour

Page	Surface	Sidebar	Ink	Primary	Lavender
#F7F8FD	#FFFFFF	#EEF1FE	#1B2140	#3F5AE0	#F0EAFF

Grades are the signature

The one thing only this product has is the grade on every fact. It gets one consistent chip everywhere, in tables, findings and answers, and the same four colours mean the same thing on every screen.

- Confirmed
- Probable
- Hypothesis
- Lead

Status words, one set for the whole app

- Running
- Ready
- Ready with gaps
- Waiting for you
- Stopped
- Not researched

Type

One family, Plus Jakarta Sans (as on the October canvas), with tabular numbers. Six sizes: 28 page title, 18 section, 15 reading text, 14 interface, 13 secondary, 12 small. Weights 400, 500, 600, 700.

Synthetic Holdings

Key findings

Synthetic Holdings runs Salesforce as its CRM and SAP for finance.

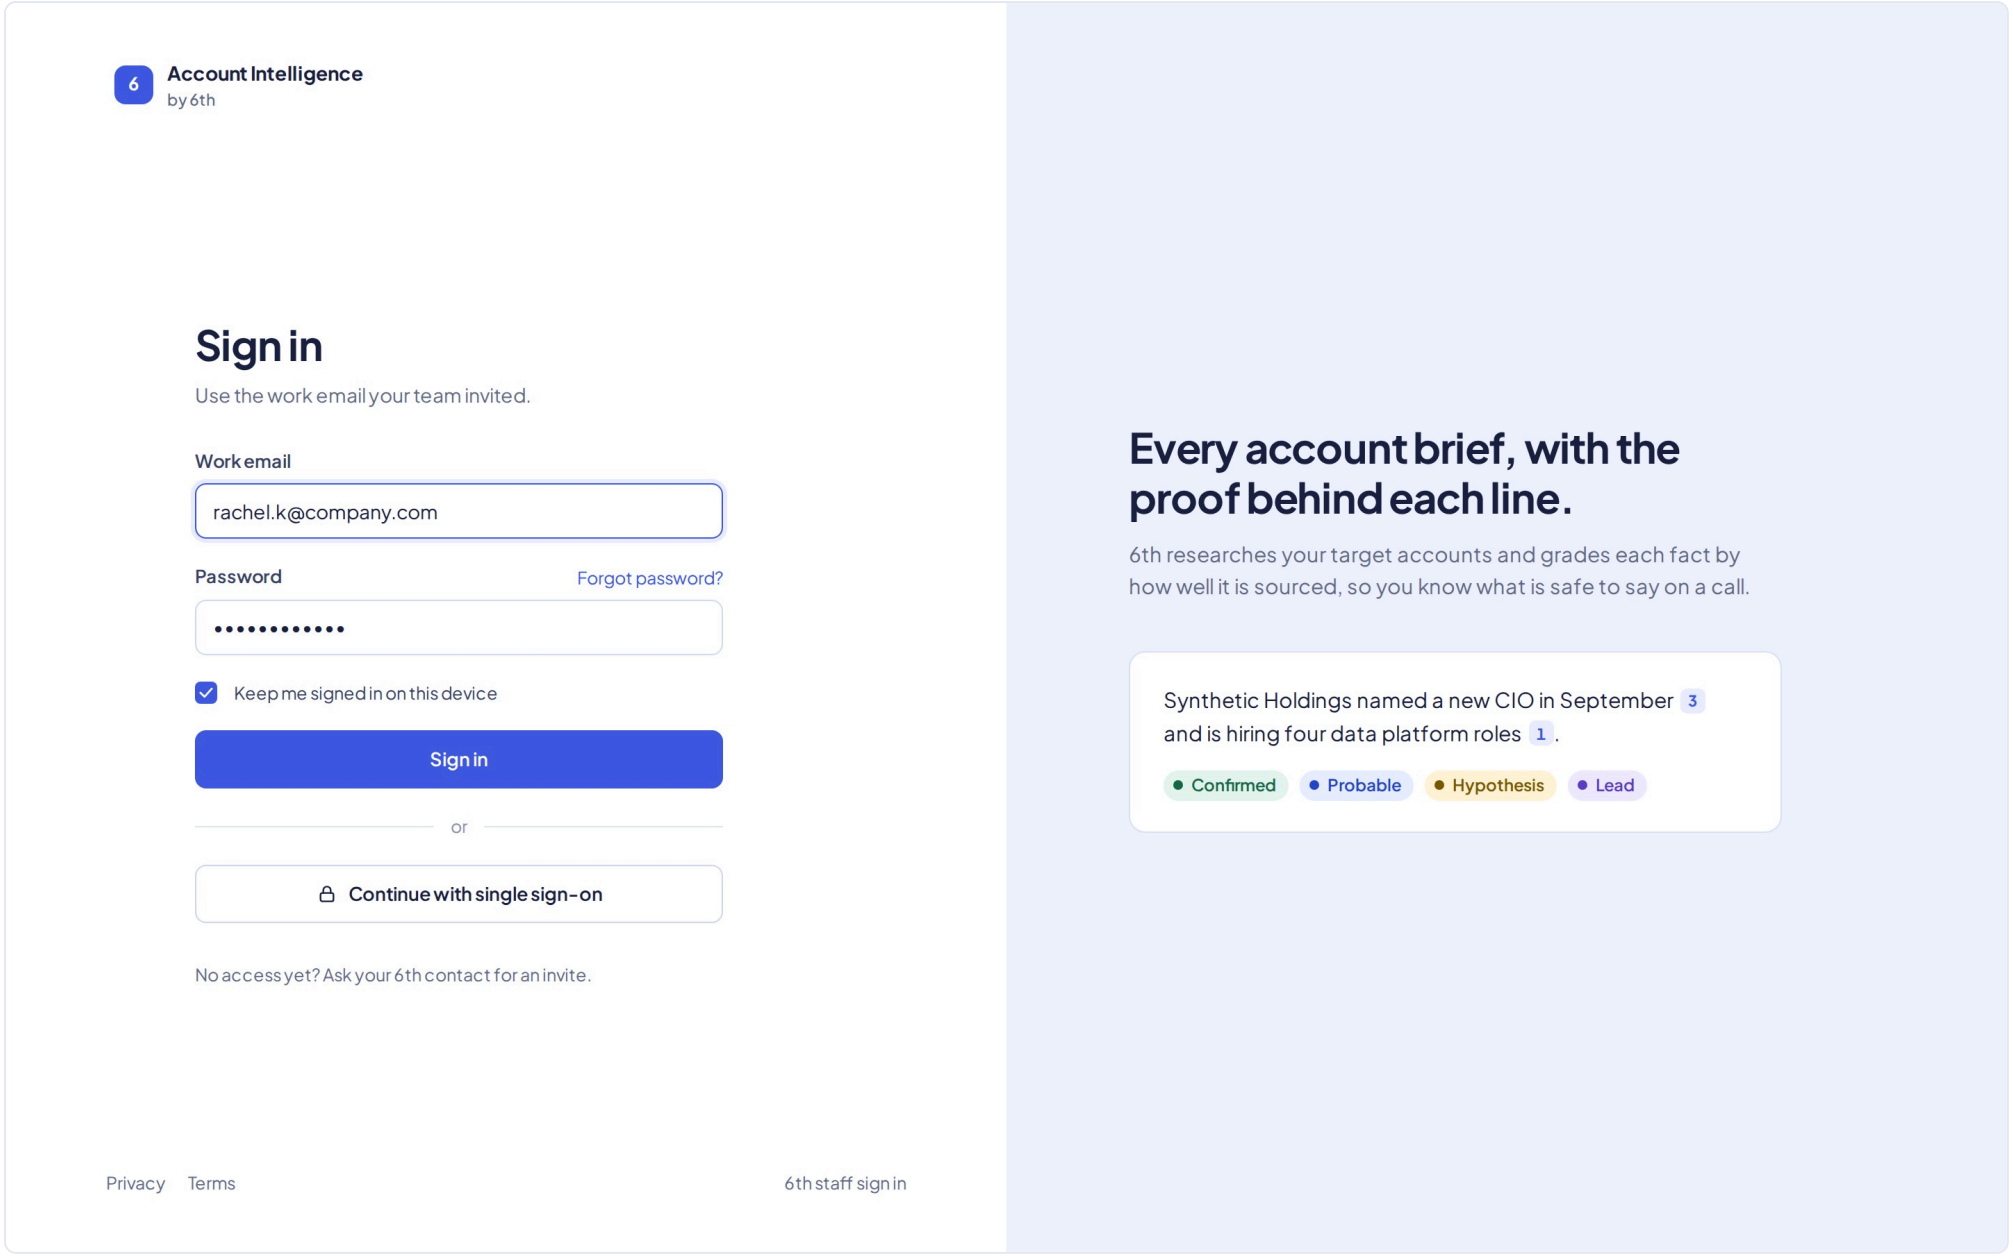

Researched 4 days ago from public sources

Rules

- Two corner sizes: 8px for controls, 12px for panels. No drop shadows.
- One main (blue) button per screen. Delete lives in a … menu, never beside the main action.
- One table component for every list and sheet, with a real pager.
- One dialog for every confirmation; no browser confirm boxes.
- Plain words only: what the user will see, not how the system works.
- No inline styles in the app (your CSP), so all of this lives in tokens and classes.

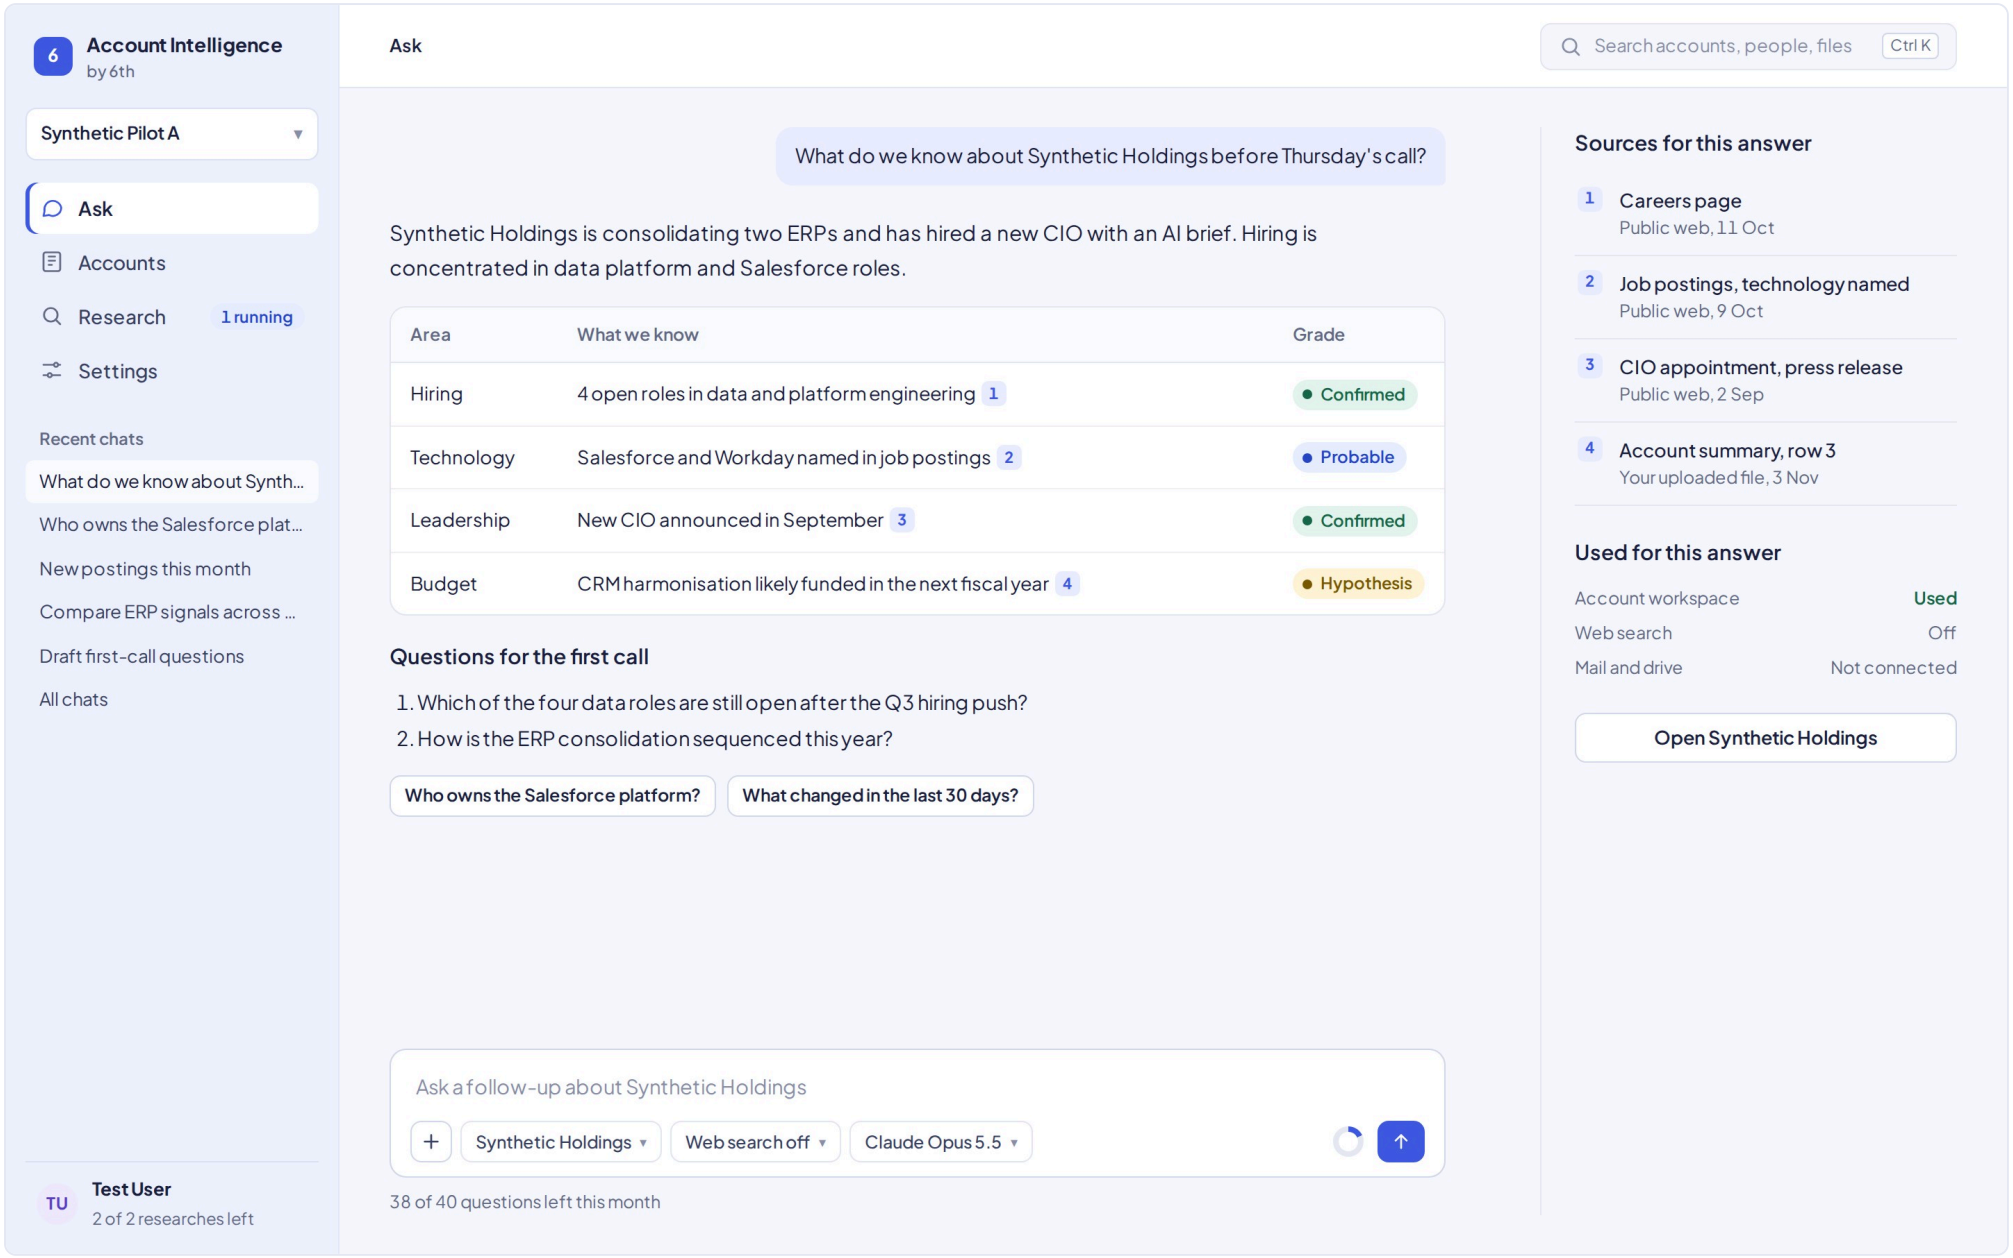

Sign in

Same split layout, calmer. The right side shows the product's real promise: a sentence with citations and the four grades. Staff sign-in moves to the footer. Workspace picker (not shown) lists names, not IDs.

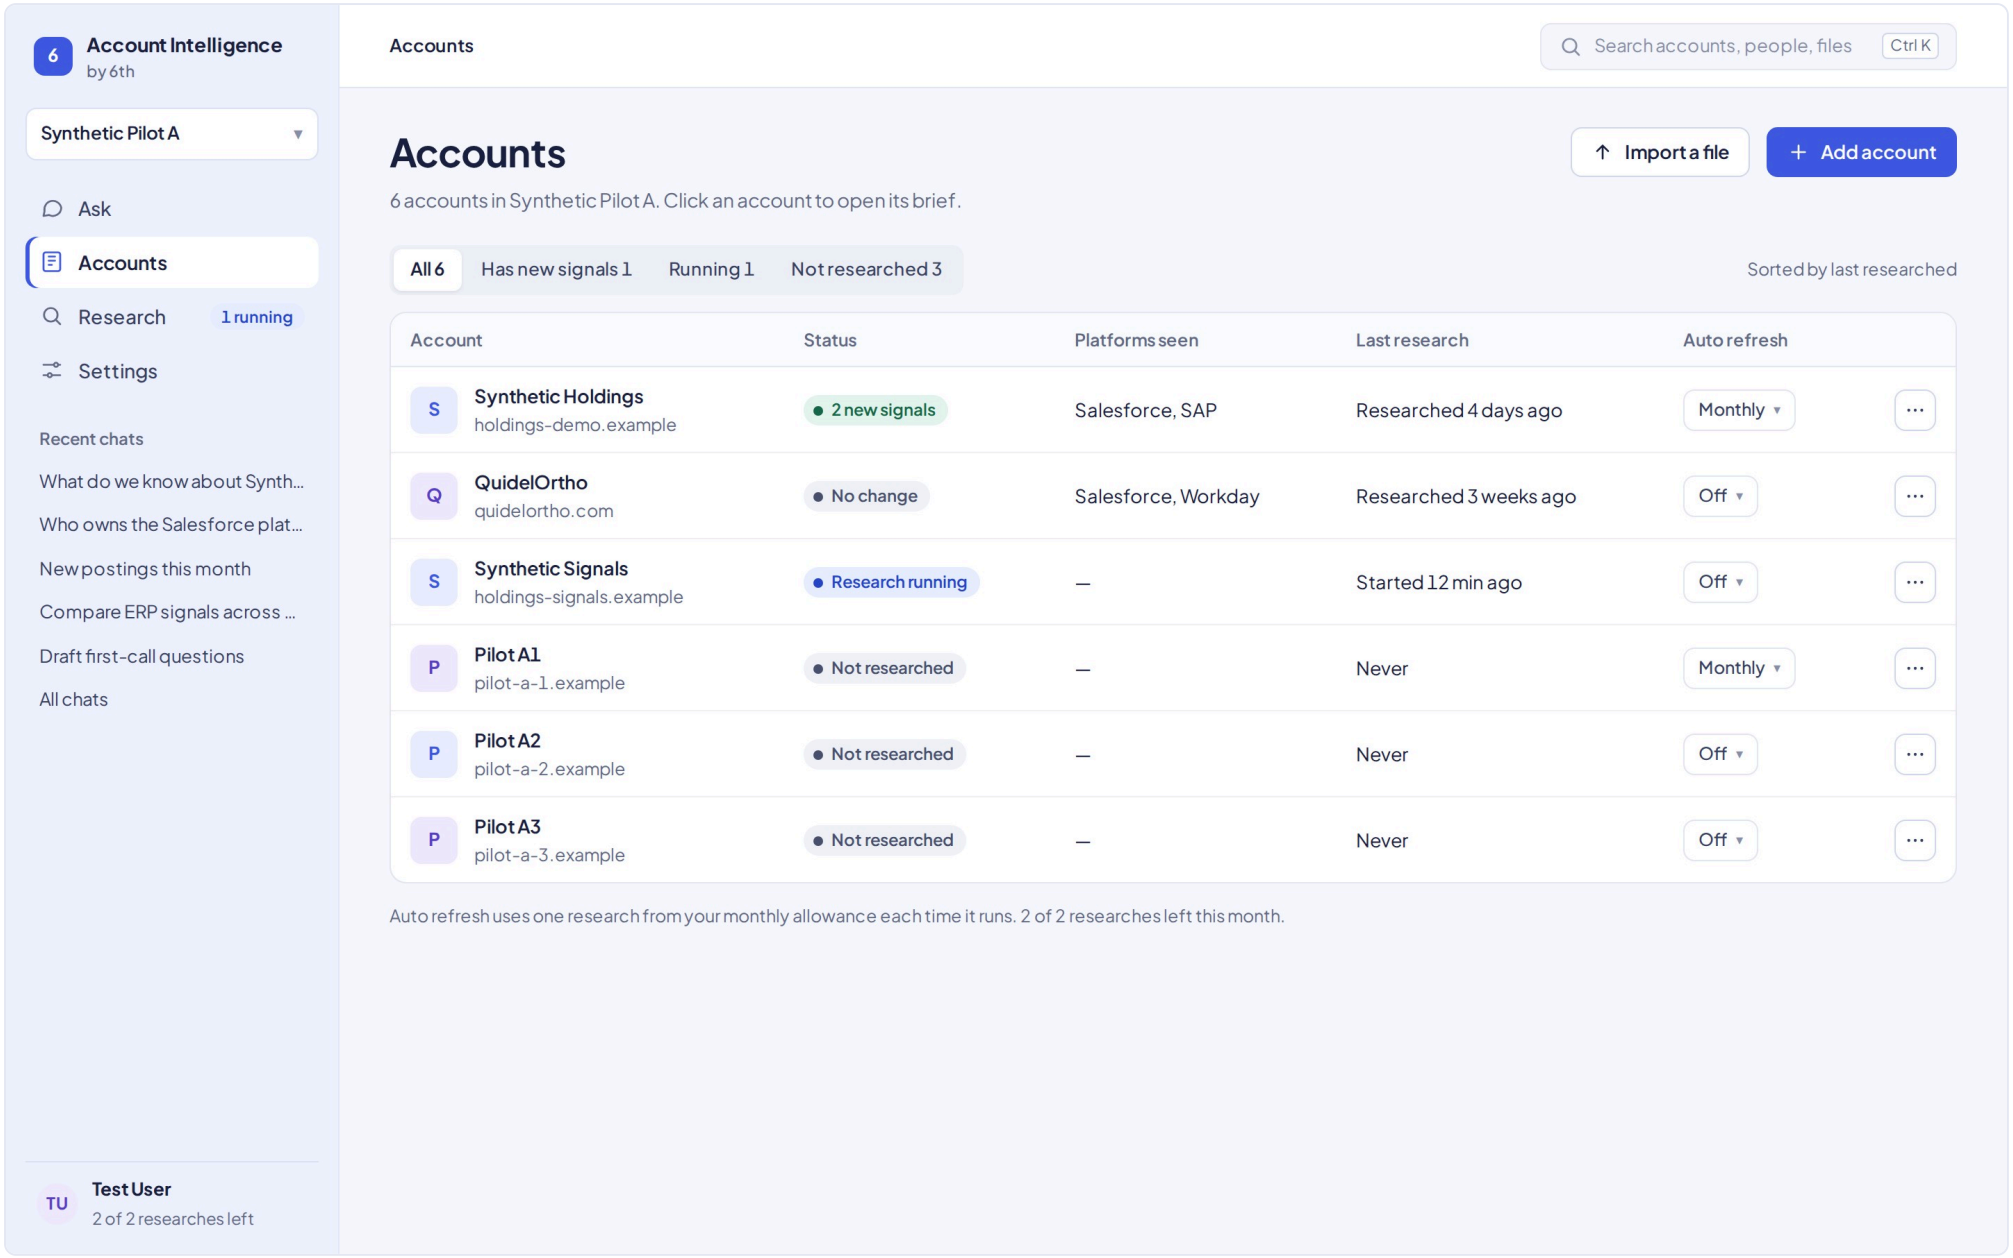

Ask

The answer is the page. One composer row: account, web search, model, and your context ring. Sources sit in one column on the right with where each came from. The $ line under each answer is gone from view.

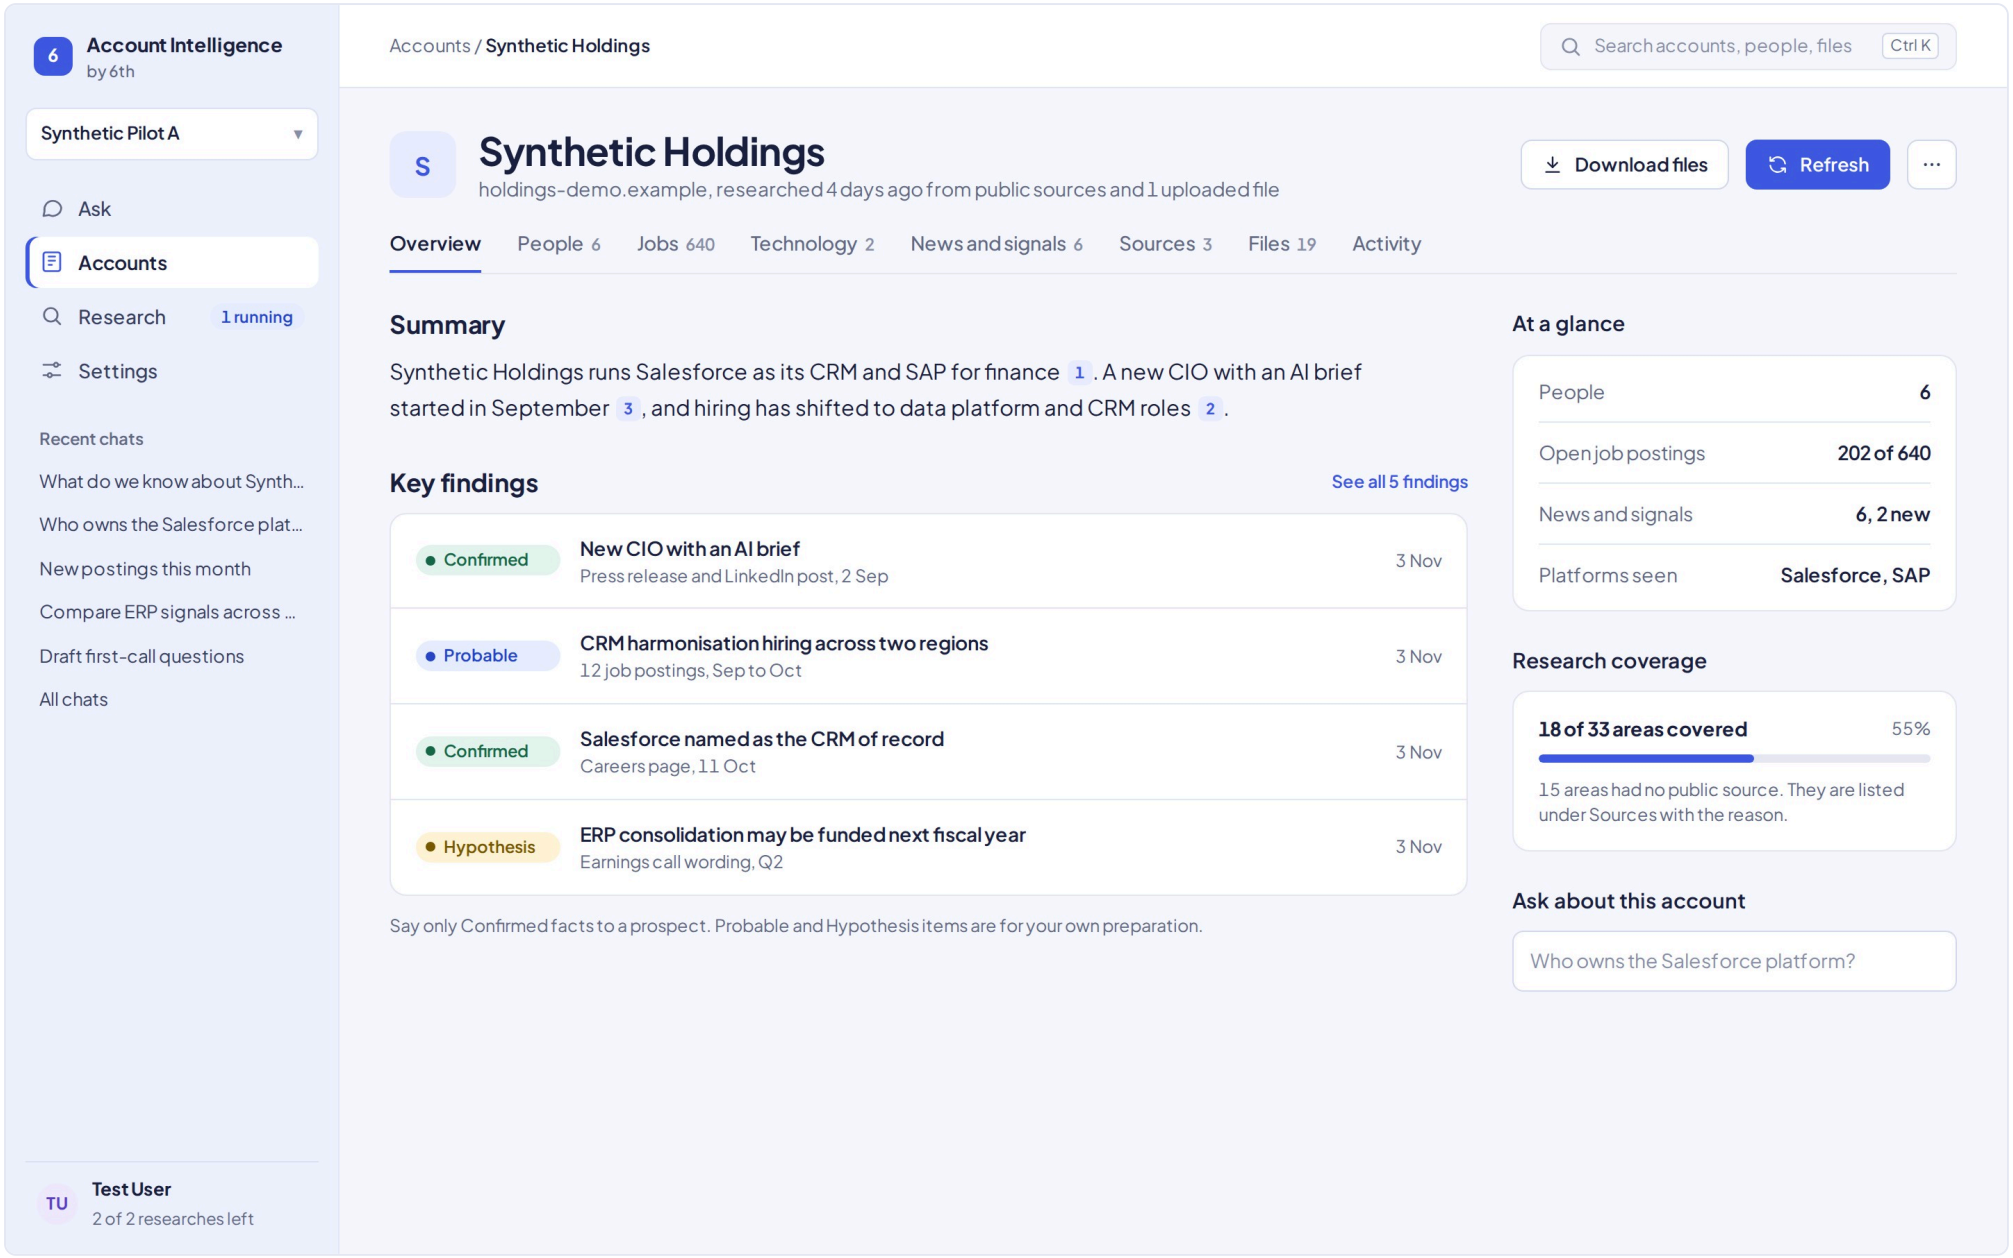

Accounts

One table, one status per account in plain words, the platforms we saw instead of "No lanes yet", auto refresh edited in the row. Filter by status. Import a file sits beside Add account.

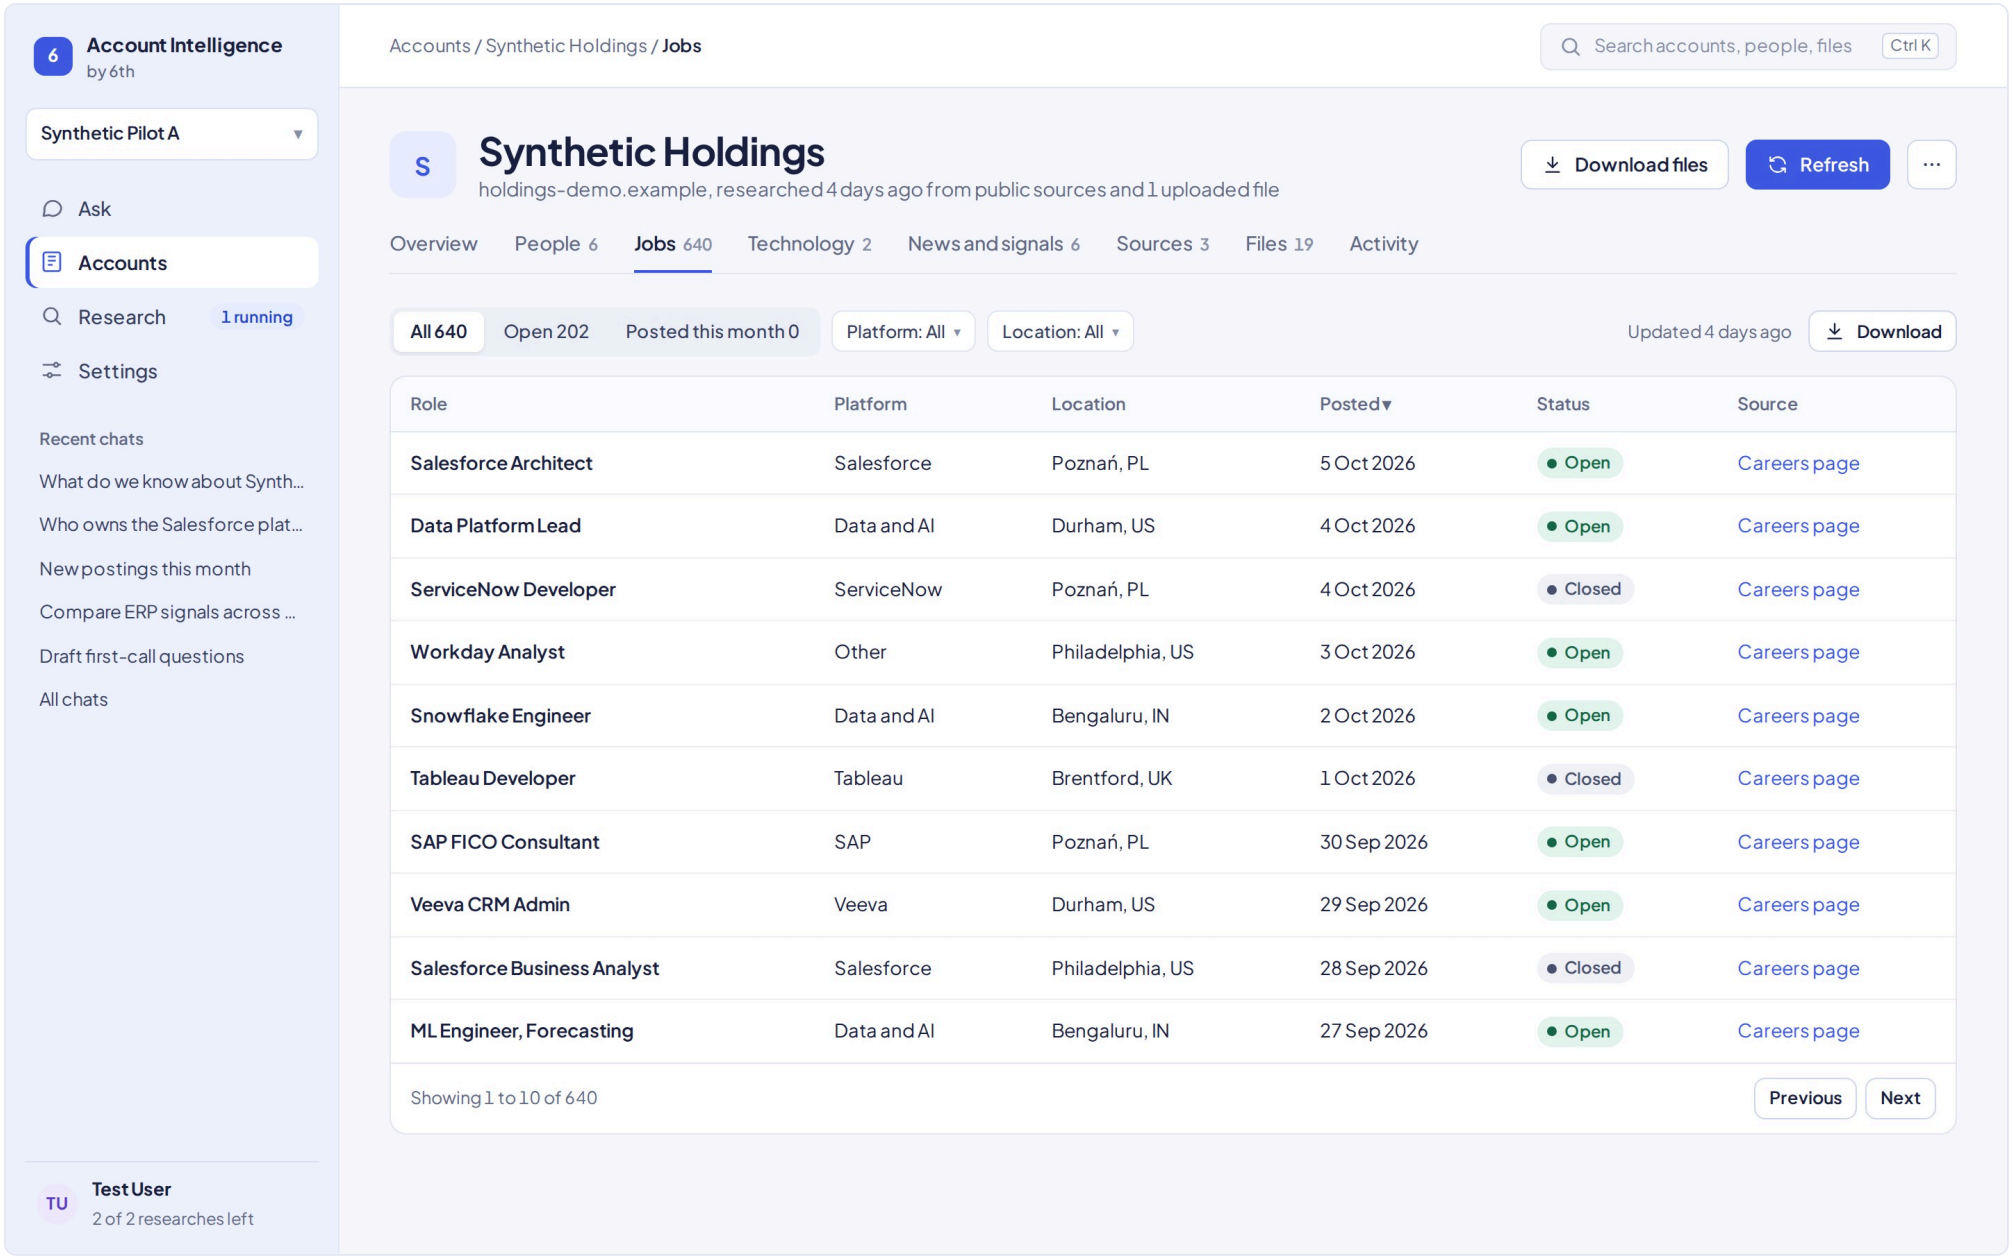

Account, Overview

Tabs replace the 17-link rail and the 4 tiles. One main action (Refresh); Schedule and Delete move into the … menu. Coverage becomes one honest line: 18 of 33 areas, with the gaps listed under Sources.

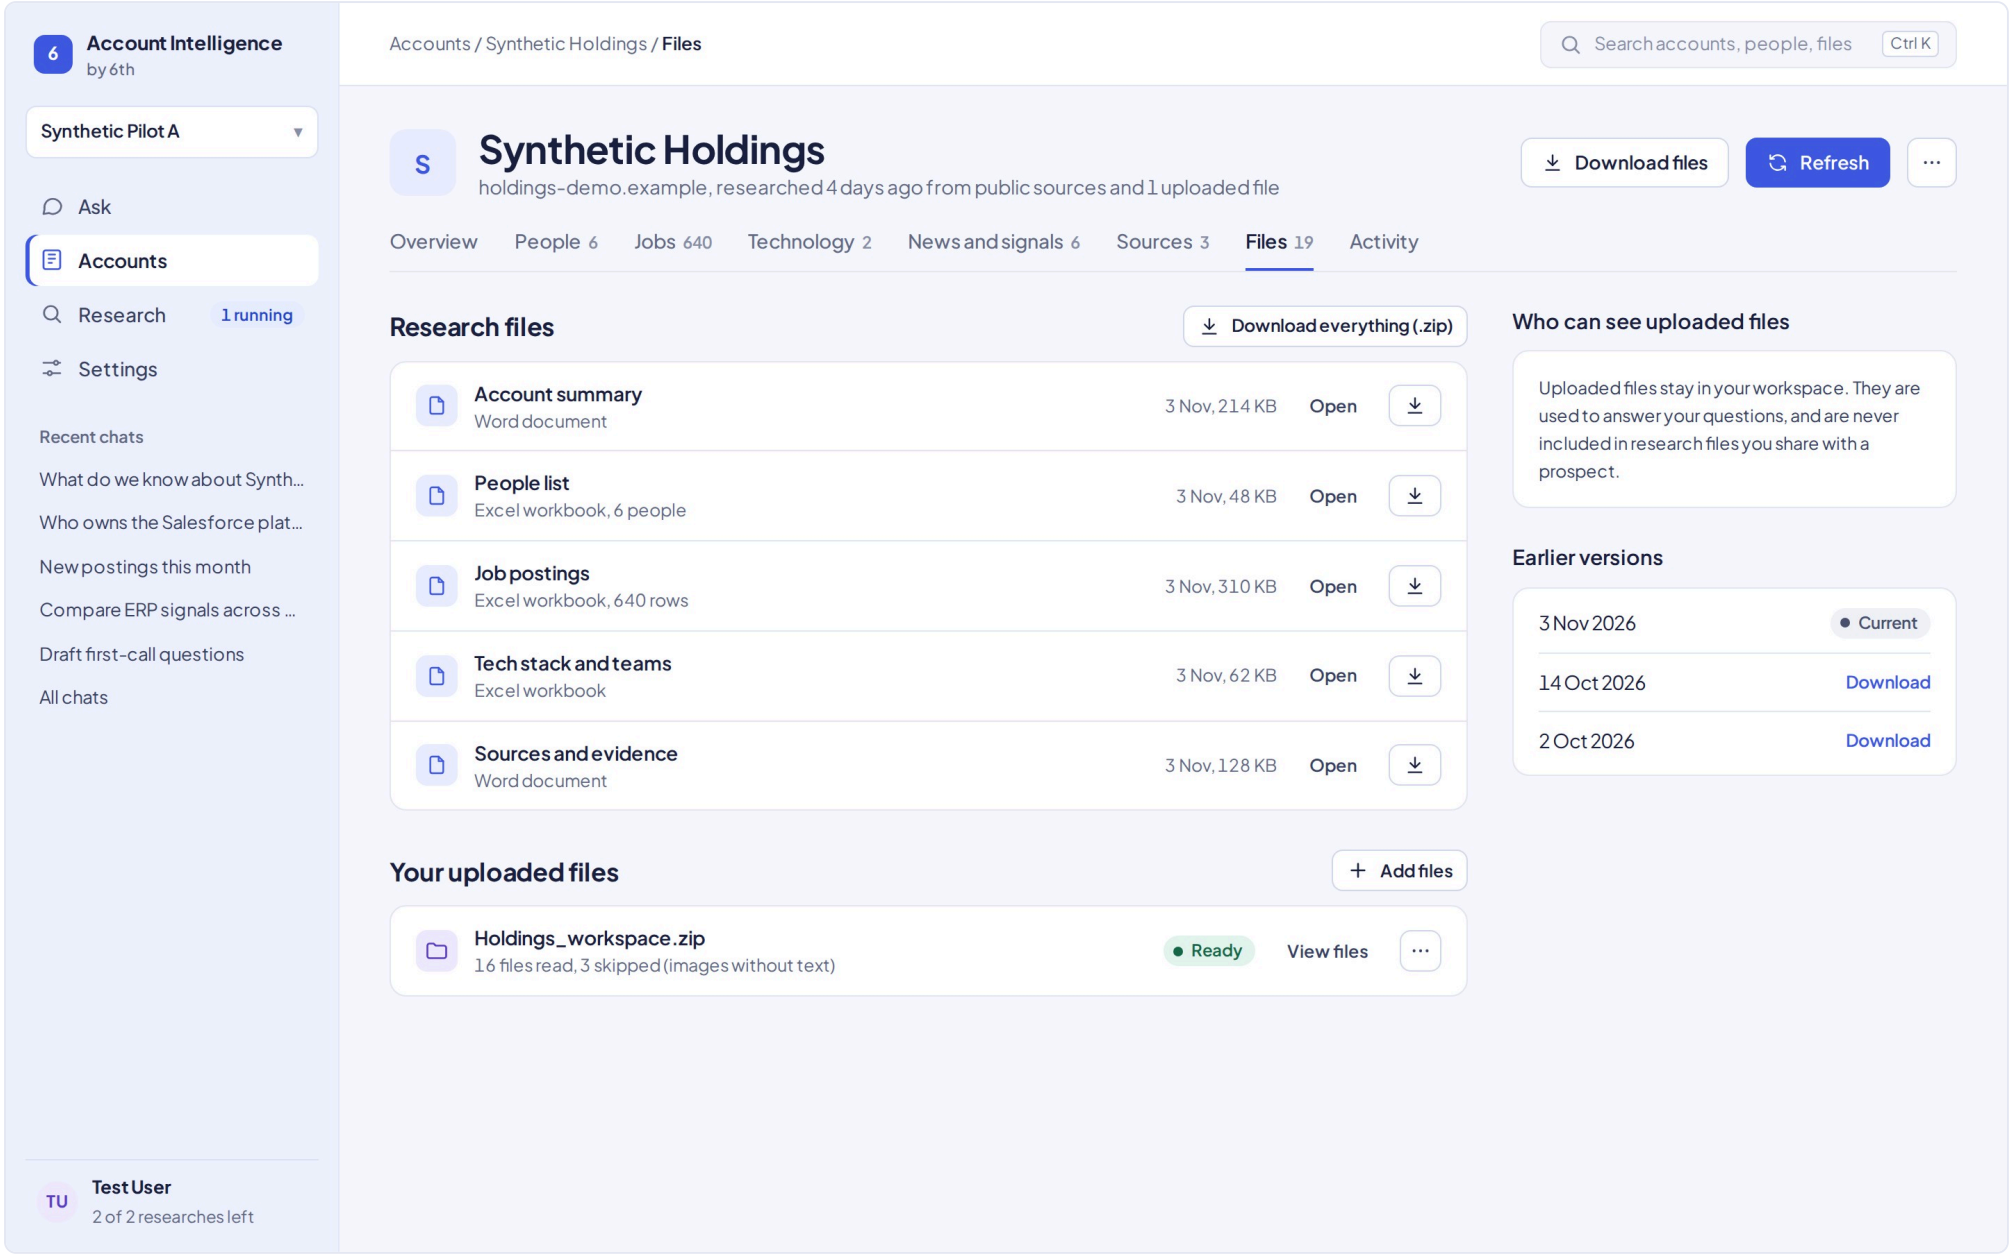

Account, Jobs tab

Every data sheet uses the same table: readable platform names, a real pager, filters that only show when they have rows, one Download button.

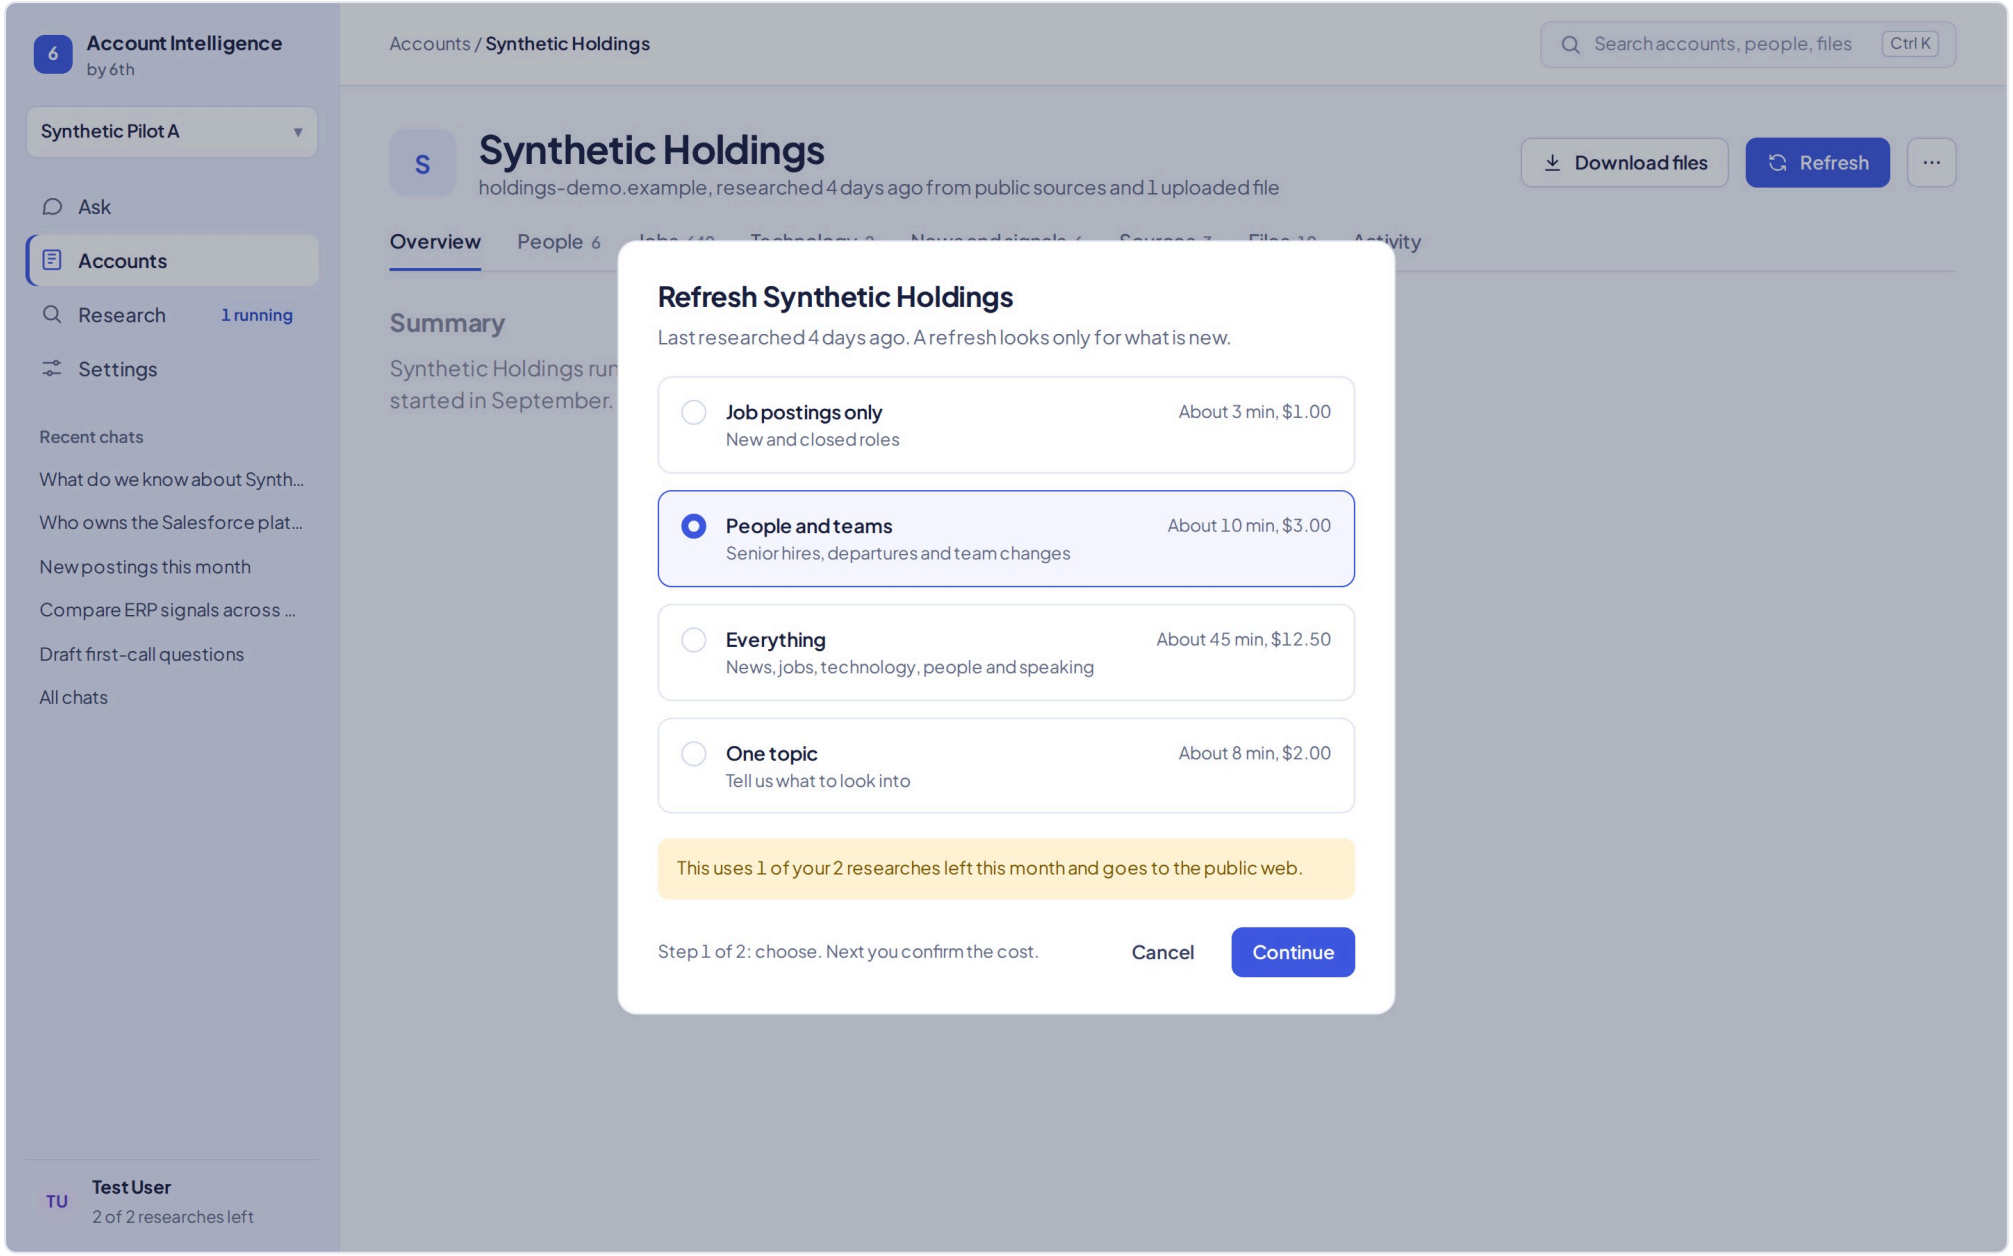

Account, Files tab

Research files, your uploads and earlier versions in one place. One "Download everything". The privacy rule is stated once instead of on every row.

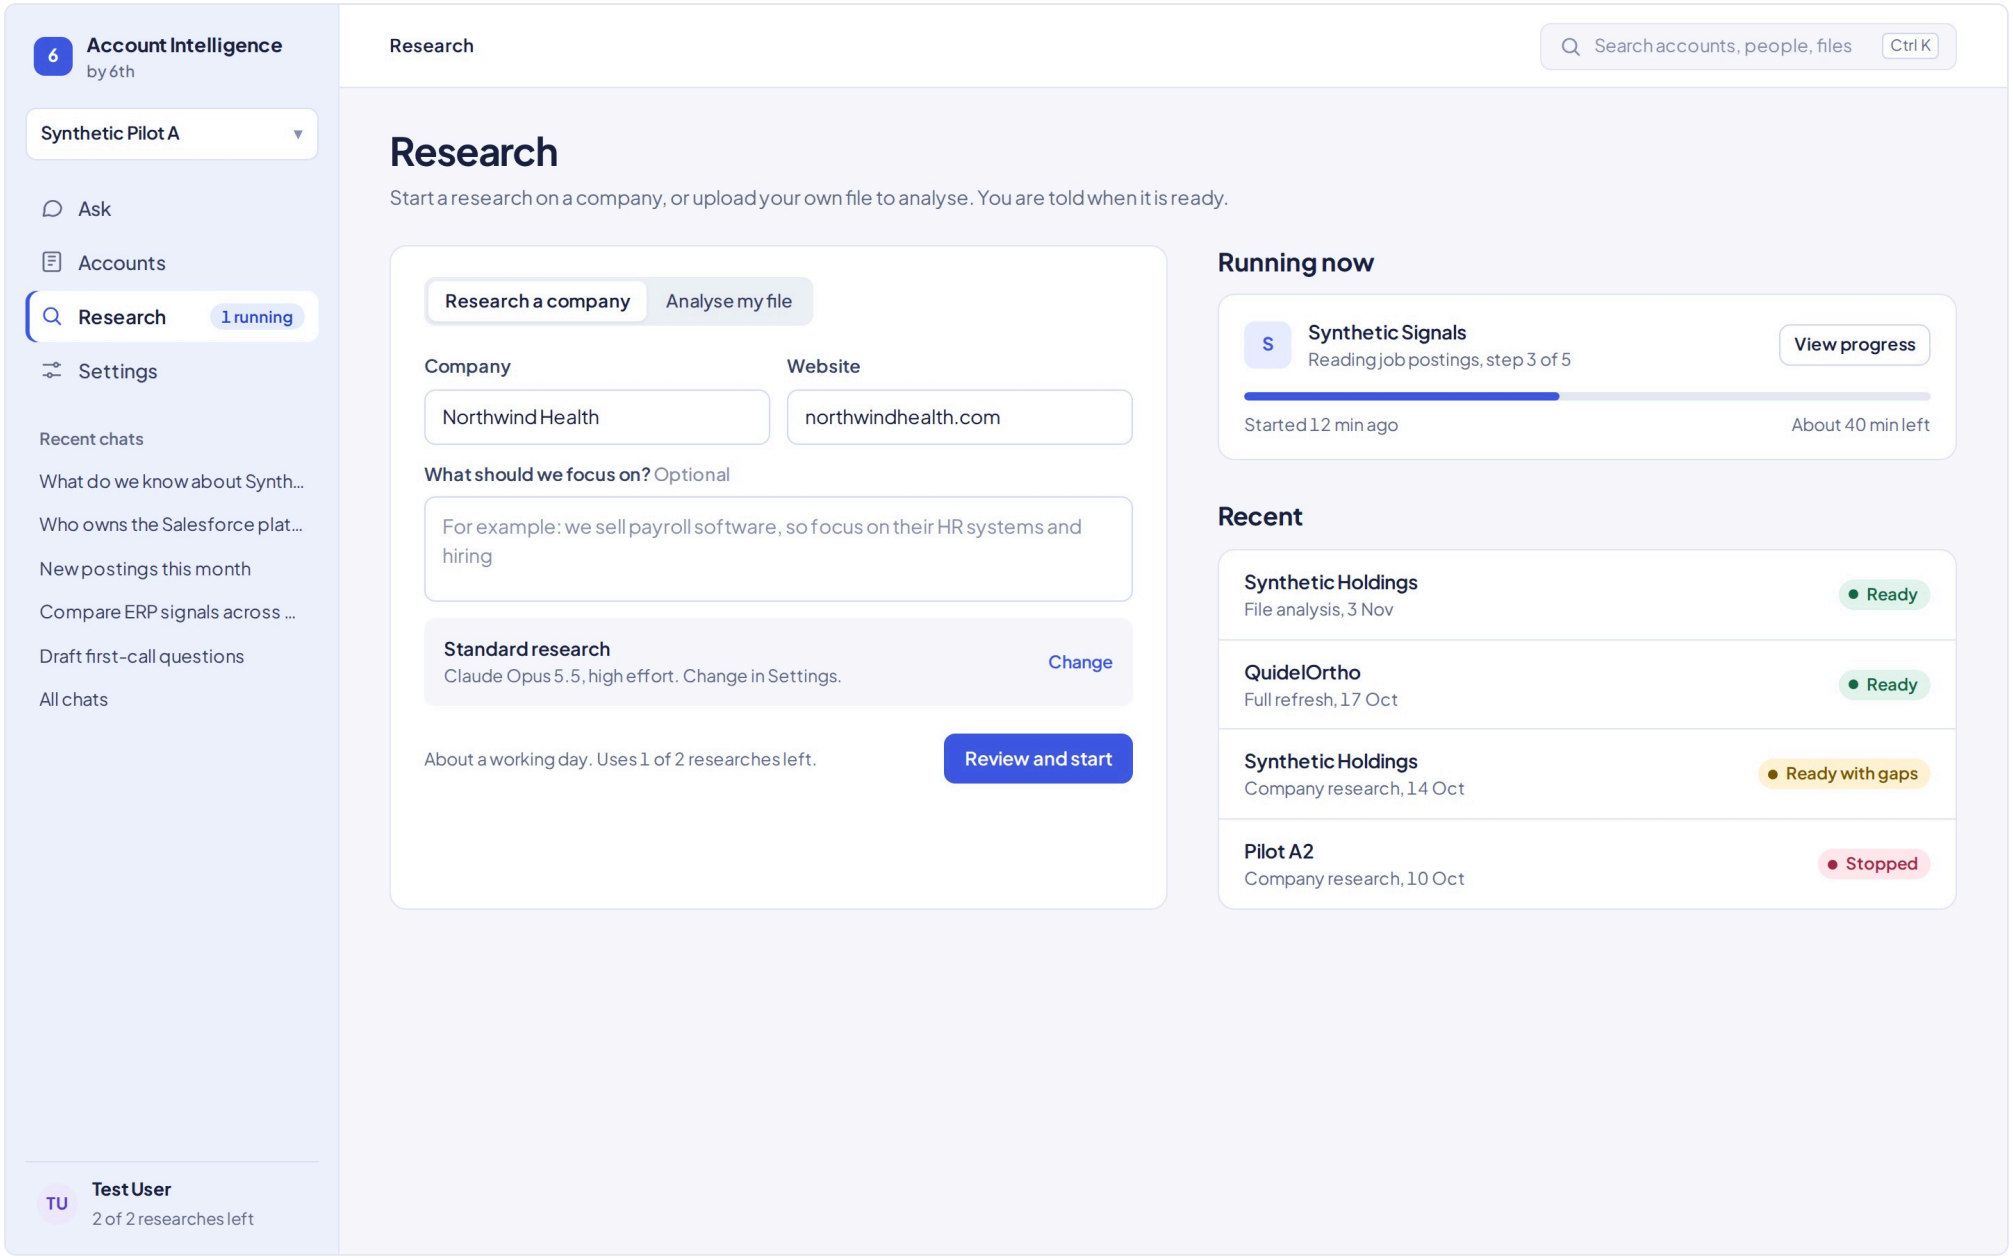

Refresh dialog

Refresh opens over the account instead of a separate page. Step 1 picks the scope with time and price; step 2 confirms the cost (your confirm-twice rule stays).

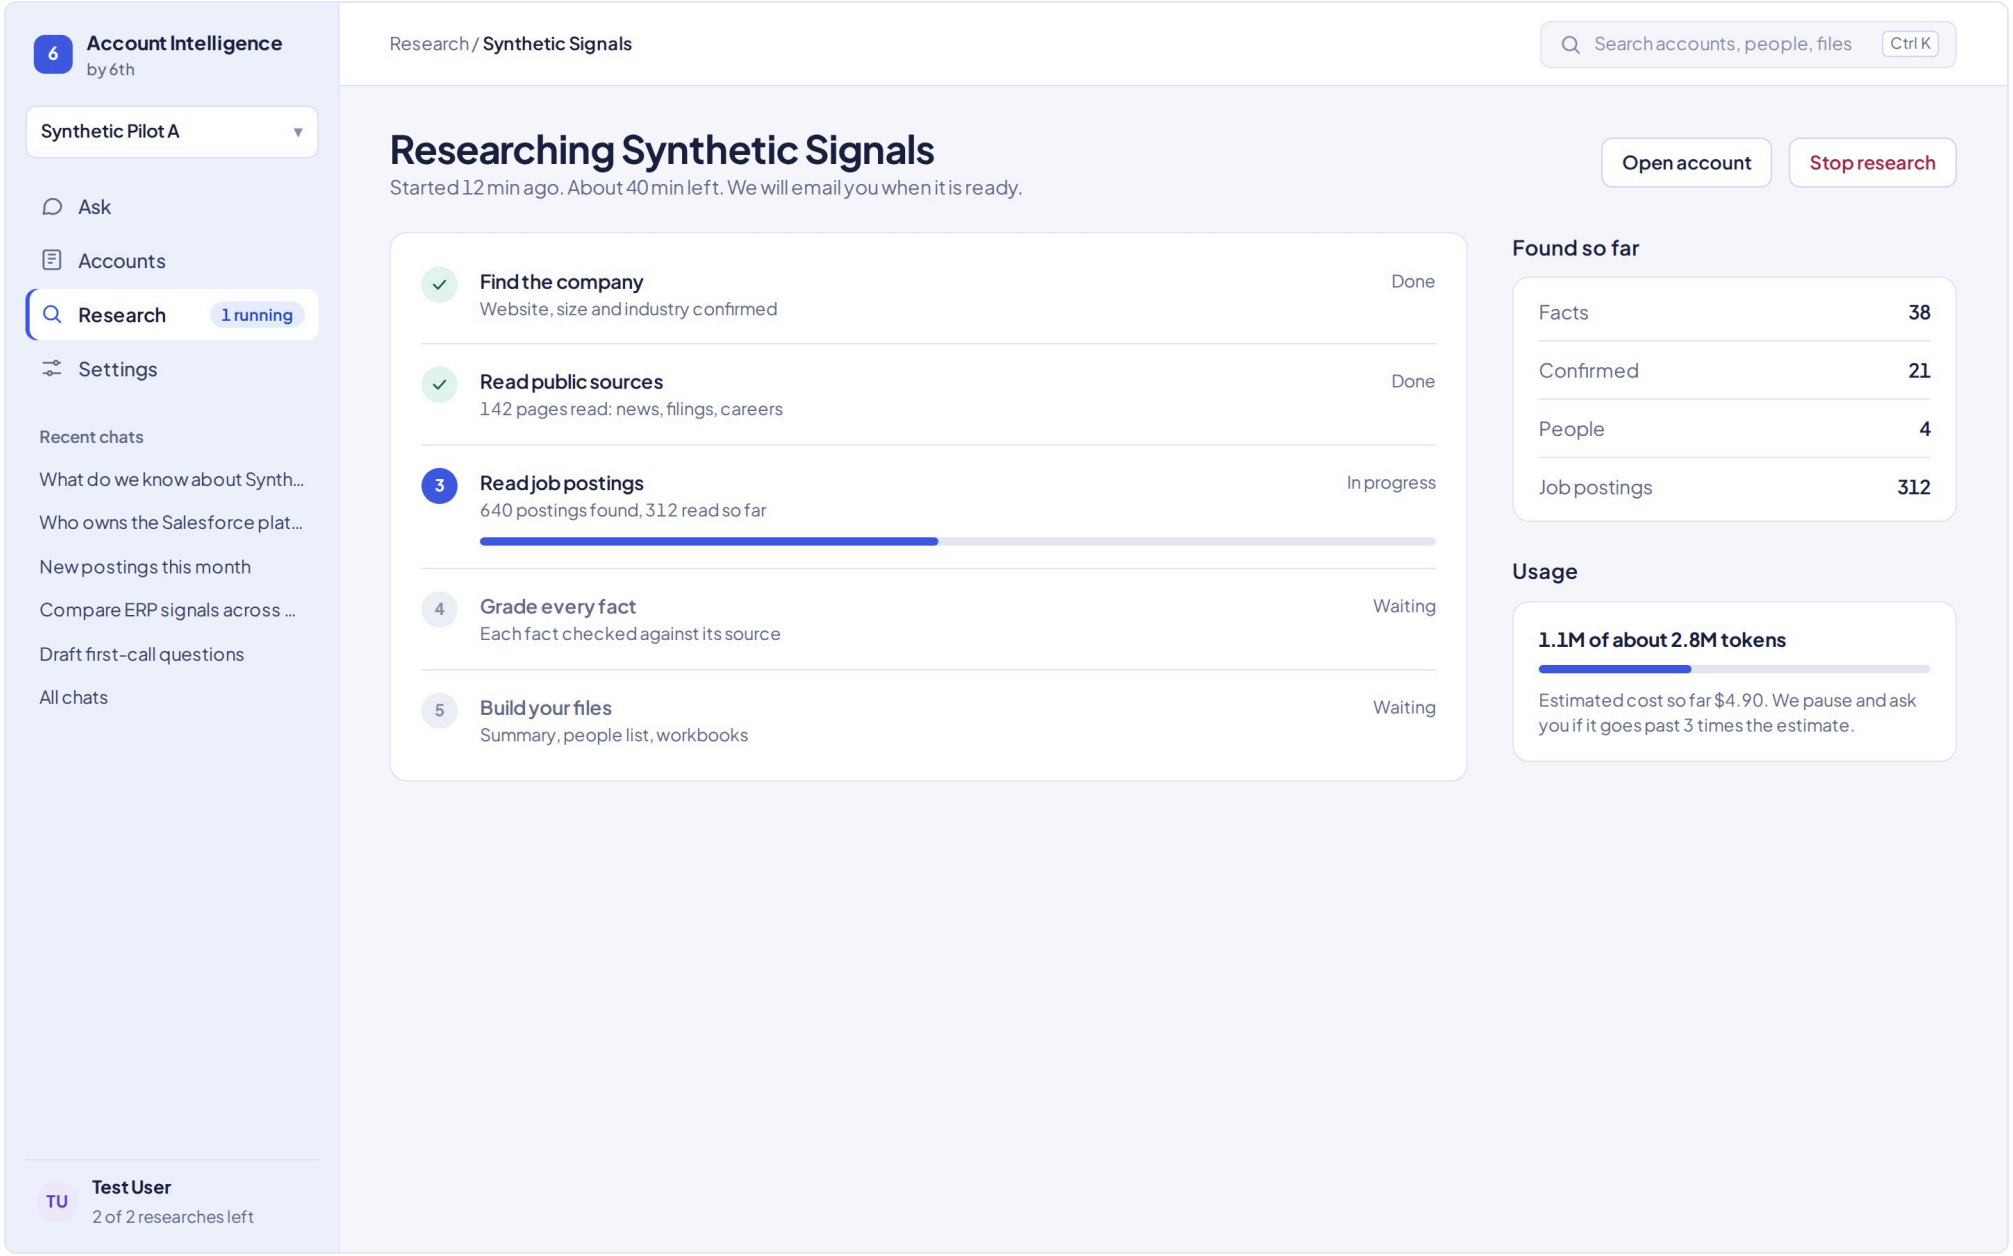

Research

Start a research and watch it in one place. Model choice is one line with a link to Settings. Recent runs show plain results: Ready, Ready with gaps, Stopped.

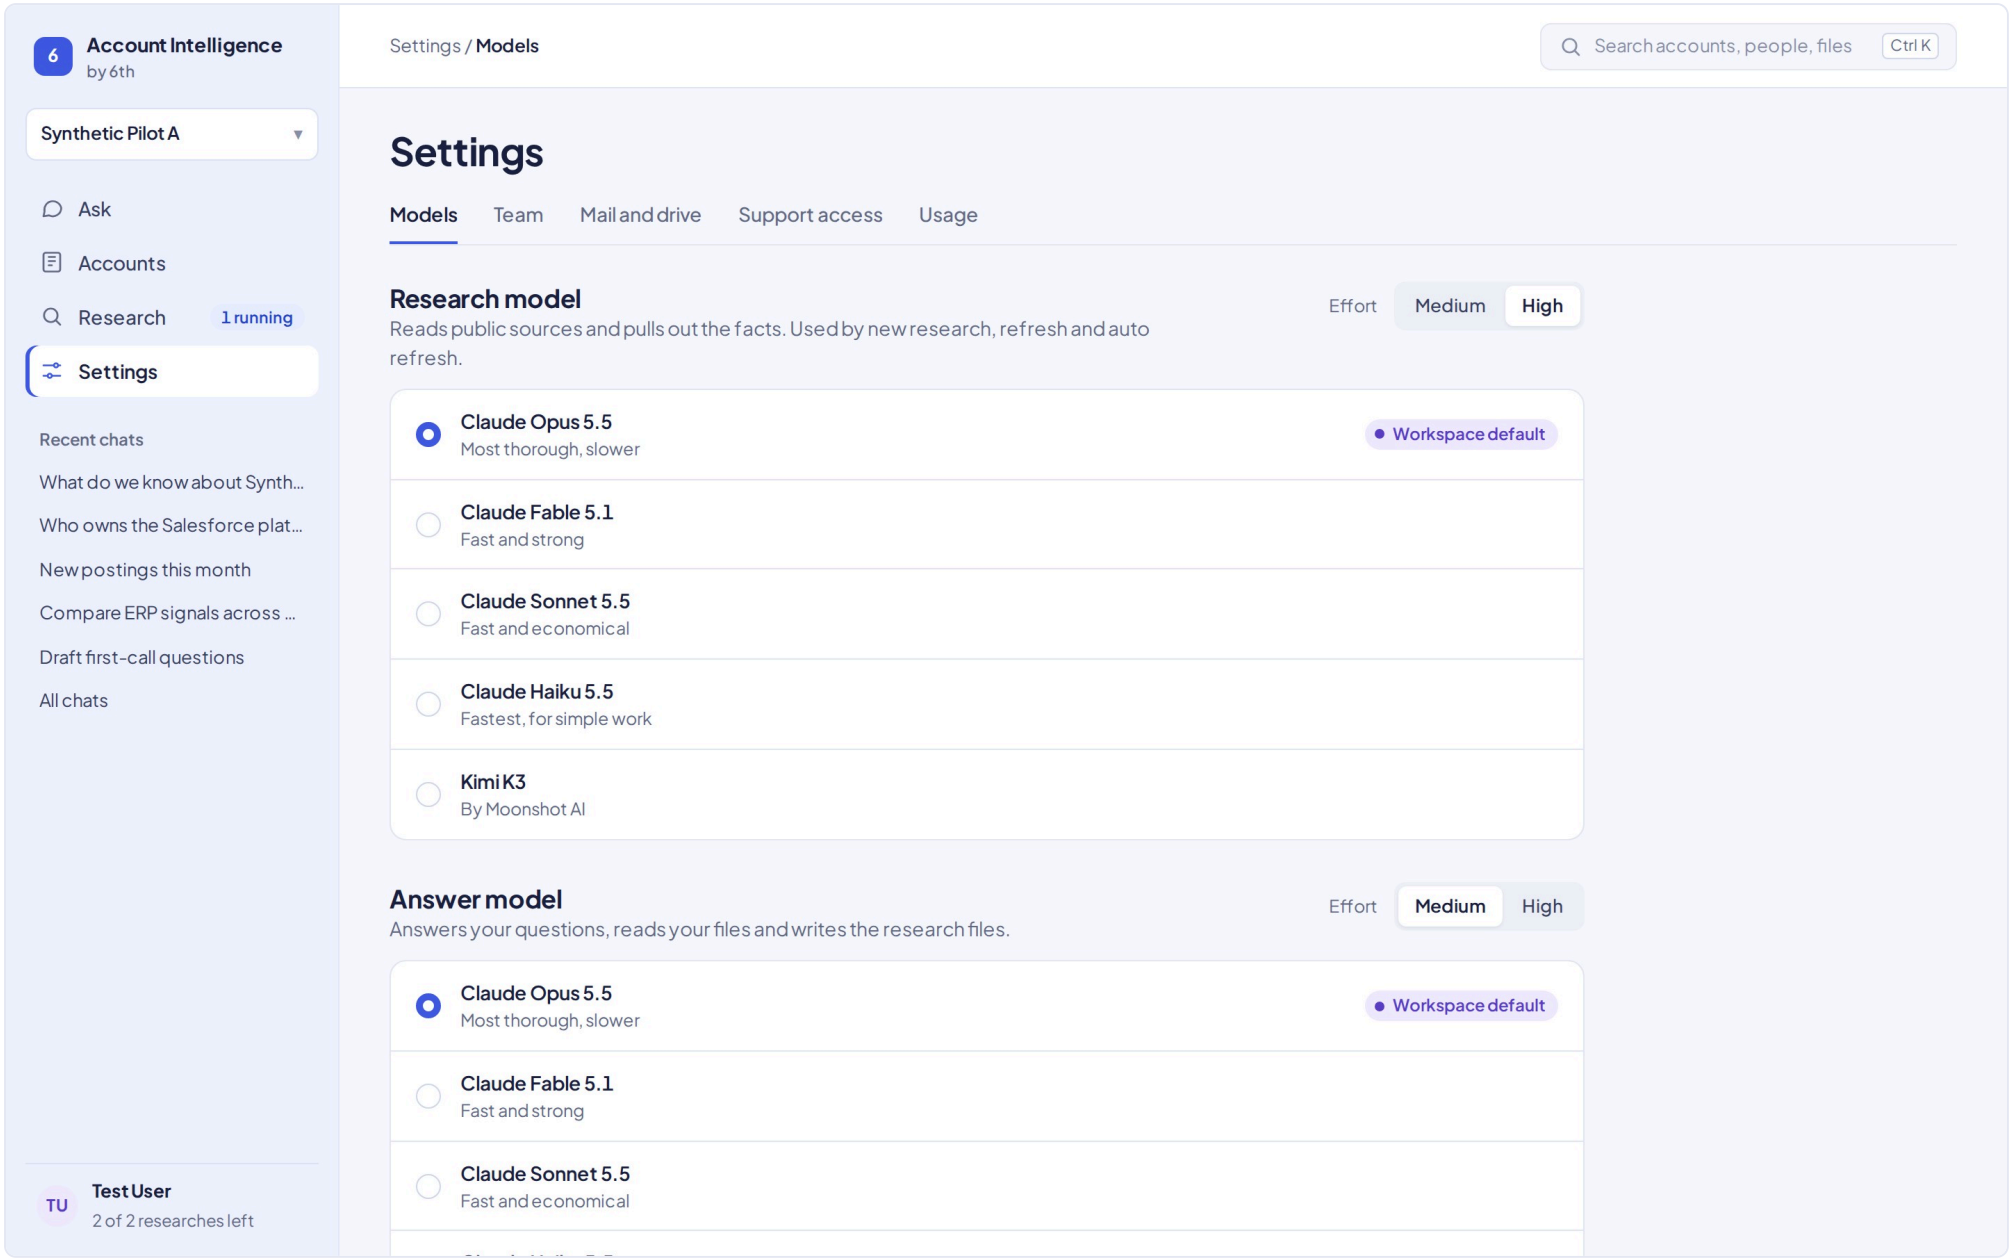

Research progress

13 internal steps become 5 plain ones. Live counts of what was found, tokens against the estimate with the 3x pause rule, and a clear Stop.

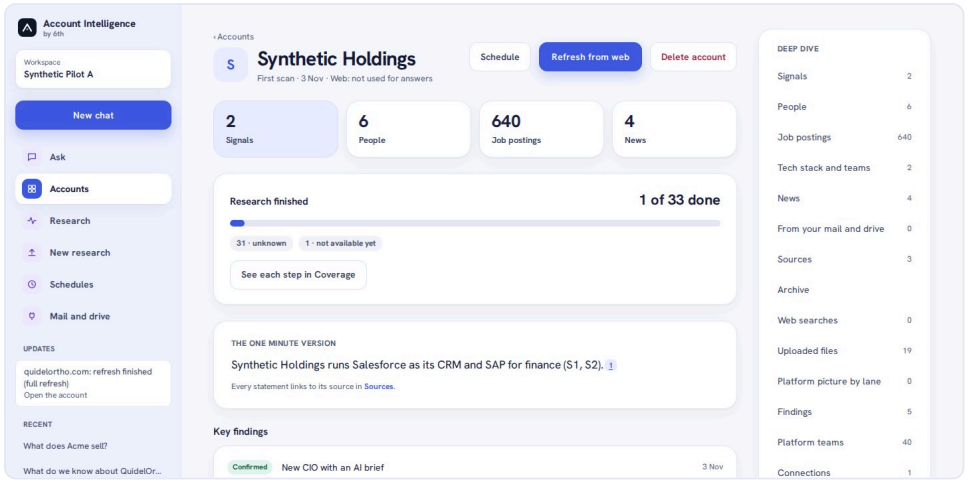

Settings, Models

Every workspace setting behind one nav item, as tabs. Models are a simple radio list per job with the effort switch beside it.

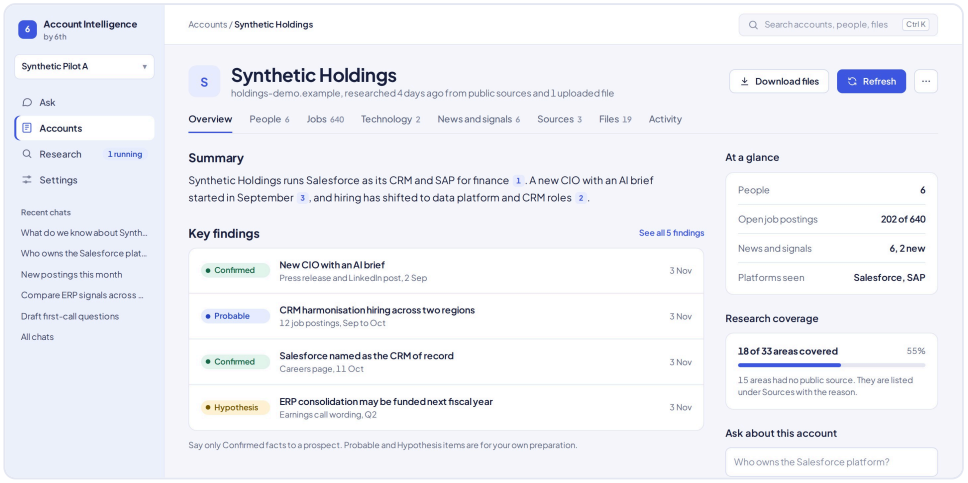

Before and after, side by side

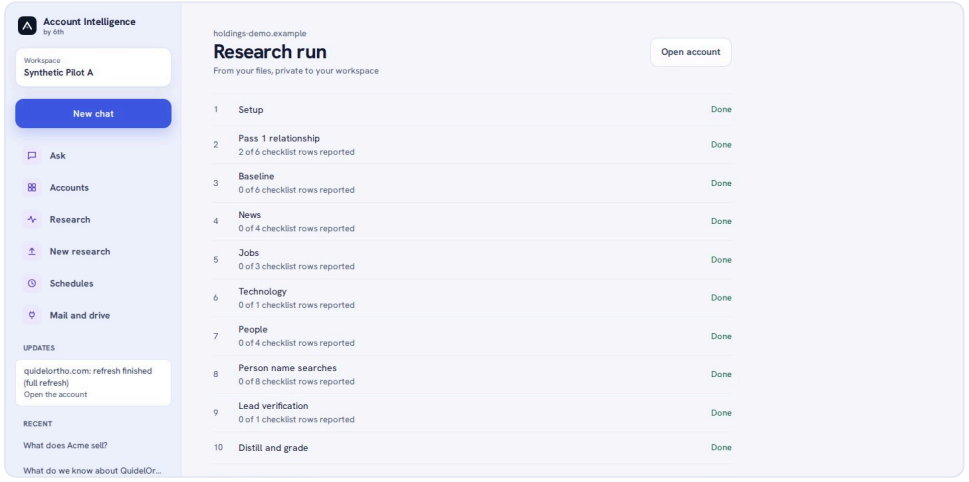

Today: Account

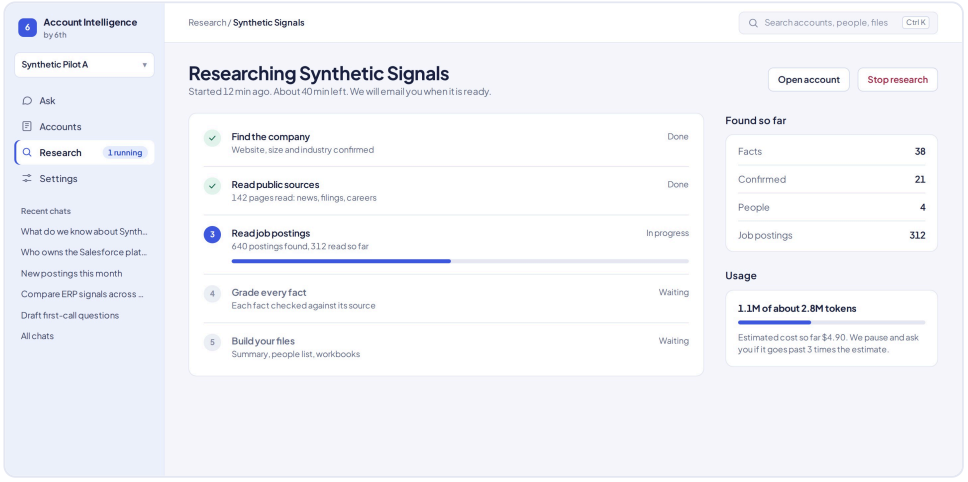

Proposed: Account

Today: Research run

Proposed: Research progress

Backend, as the client app uses it

Every client page was traced to its API calls and handlers. Two drift checks pass ("openapi snapshot OK", "generated client OK"), so no page calls a missing endpoint. The problems are slowness, internal codes in responses, and status words the screens have to translate.

Slow because of how pages load

- **Every page change costs 4 calls** (me, chat threads, notifications, model choices). `GET /v1/me` also writes a "last active" row and runs about 7 queries. The chat list returns 100 threads to show 6.
- **Opening an account can rebuild files inside a read.** `GET …/workspace` may regenerate stale tables (`account_workspace.py:155-176`) and runs a count with about 20 subqueries. When it passes the web's 10 s limit the user sees "This account could not be loaded".
- **Each data table page re-downloads the whole bundle** from storage and slices it in memory (`parity/service.py:344`). A tab with K tables costs K+1 downloads.
- **A running research is polled in three ways at once:** run status every 5 s, live spend every 5 s (by accident: `RunSteps.tsx:278`), and a 1 s database poll per open tab.
- **The Research board stream** rebuilds the whole snapshot every second per viewer, and reconnects every 5 s forever when nothing runs.
- **The document page makes up to 50 calls in a row** before it shows anything.
- **Accounts list** computes every account, then limits; the web asks for 200 and never pages, so account 201 onwards silently disappears.

Internal codes sent to the client

- `GET /v1/runs/{id}` returns the raw stop reason (can be a Python error name), stop detail ("made no progress in N slices"), gate defect codes and paid/cached call counts. The run page prints them. A good translator already exists (`replica/workspace.stop_text`) but this endpoint does not use it.
- Research board shows "Reason: credit_cap_reached"; a running job is labelled "Starting".
- Error texts mention "tenant"; Delete account shows "(403 csrf_refused)".
- Teammates: "already a member" can never show, because the API turns that reason into "Conflict" (`api/problem.py:30`).

Ten status vocabularies

Run (10 uppercase values), research job (6 lowercase), account state (7), document (12 + 8 stages), coverage (6), step (6), live spend, download, gate ("pass" and "passed"), and error type (slug or number). Proposal: one `research` object everywhere with state *waiting, running, needs_you, done, done_with_gaps, stopped, cancelled*, a server-written label and one human sentence, never a code.

Backend: safety and the changes to make

What holds

- Default-deny routes; role, membership and CSRF checks on every write; row-level security per workspace.
- Cross-site writes refused at the web proxy.
- Confirm-twice (428) is enforced on all four start doors: new research, resume, new run, refresh. Automatic starts stay off.

Gaps

- **Continuing a paused run skips confirm-twice**, including past the 3x token guard, and "Auto continue" approves later pauses with no click.
- **`POST /v1/runs` with a company domain skips the per-user research quota** that `POST /v1/research` applies.
- No short-term rate limit on new research, refresh or Ask (only monthly quotas).
- About 60 endpoints with no client screen are reachable by any client session and ship 154 KB of contract code to every browser.
- Strict response parsing: a new API field breaks older web pages until both are redeployed.

Backend changes, by impact

#	Change	Where
1	Run status returns only client words: state, label, tone, one sentence	`runs.py:413`
2	Cache the table bundle per version	`parity/service.py:344`
3	Make the account read read-only; store counts at delivery	`account_workspace.py:288`
4	One live endpoint per run (status, steps, spend, files)	`runs.py:767`
5	One shell call for the sidebar; no write on `/me`	`me.py:56`
6	Batch file status instead of 2 s polling per file	`documents.py:392`
7	Accounts list: page, sort and search in SQL	`accounts.py:96`
8	Research board: one shared snapshot, no idle reconnect loop	`live.py:84`
9	Errors always carry a slug and a plain sentence	`users.py:111`
10	One start gate: same quota on every door; decide confirm-twice for Continue	`runs.py:136`
11	ETags checked before heavy work	`runs.py:420`
12	Return domain on run create; filter exports by run	`runs.py:198`
13	Whole-text or larger pages for documents	`documents.py:512`
14	One status vocabulary on every surface	`replica/live.py:57`
15	Trim the client contract; non-strict response parsing	`gen_web_client.py`

How we would build it

In four steps, each one shippable on its own. Following your rule from October, step 1 changes one screen first and you see a screenshot before the rest is restyled.

Step	What changes	You see
1. Fixes and words no layout change	Fix File analysis ("undefined", overlap, 0 files), the Research board's missing finished runs, raw table values, empty filter chips and columns, the Files nav highlight. Replace internal words with plain ones in one message file. Fill legal placeholders (text from counsel). Workspace names in the sign-in picker.	Same screens, correct and readable.
2. Components and tokens	One table, badge, dialog, page header and input. Type scale and flat surfaces in `ui/tokens.css`. Restyle the Account page first and send a screenshot for your approval.	One screen in the new look, then the rest.
3. Structure	Account page tabs; Refresh as a dialog; Settings with tabs; nav to 4 items; Research page with the single start form; run page replaced by plain progress; redirects from every old address.	The new 5-area app.
4. Backend support	The API changes listed in the backend section: one client status vocabulary, one account summary call, paged documents, internal fields kept off client responses.	Faster pages, fewer loading flashes.

Rules kept throughout: research never starts without the two-step confirm; nothing is committed until you say "commit"; no deploy without your go-ahead; the operator console is not touched.

Your decision

Tick what you approve and mark anything you want changed. A few points need your call because they touch rules you set earlier.

Approve

- [ ] The 5-area structure and 4-item sidebar
- [ ] The tabbed account page
- [ ] Flat look: 8/12 corners, no shadows, one type family
- [ ] Removing the run page, Schedules, New research and All chats as separate pages (with redirects)
- [ ] Step 1 fixes can start straight away

Your call

Model and effort chips. Today on Ask, Add account and Refresh. Proposal: one menu in Ask, a single line on the research form, full choice in Settings.

Cost under each answer. The "12K in, 3K out, $0.04" line. Proposal: hide it from the answer and show totals in Settings, Usage. The context ring stays, as you asked.

Run token card. Your tokens.html design stays on the progress page; the "Units used" block goes.

Font. The app uses Hanken Grotesk; the October canvas used Plus Jakarta Sans. These mockups use Plus Jakarta Sans.
